## Acknowledgements

The preparation of this report benefited from the assistance and cooperation of a number of people including:

Dr. Nader Mryyan (Al-Manar – NCHRD)

Dr. Ghazi Shobeikat (Department of Statistics)

Mr. Mamdouh Al-Salamat (Al-Manar- NCHRD)

Mr. Khamis Raddad (Al-Manar – NCHRD and Department of Statistics)

Mr. Fathi Nsour (Department of Statistics)

Dr. Susan Razzaz (World Bank)

We are grateful to Al-Manar project staff at NCHRD for facilitating all aspects of our work, including technical support, professional insight, and for taking care of all our travel and accommodation needs during our visits to Jordan. We are also grateful to the Department of Statistics staff for providing us access to the available data and making time to answer our questions about the data.

## Foreword

The labor market in Jordan features some intriguing anomalies, the main ones of which include:

- Jordan imports hundreds of thousands of low educated, unskilled workers and yet has a large pool of unemployed with similar qualifications.
- The number of female students is close to or exceeds the number of males in almost all levels of education, and yet Jordan has one of the lowest female participation rates in the world.
- Jordan has enjoyed a high and consecutive GDP growth in the last five years but its unemployment rate persists at 14% annually, despite the fact that the demand for labor has been dynamic with the pressure for workers moving from one sector to another and from one occupation to another from year to year.

Apart from the above anomalies, there are other labor market features that must be highlighted.

The Jordanian labor market is in the middle of a child boom, with the largest five-year age cohort being the 10-14 year olds. This bulge will reach the working age over the next decade, and by 2011 the youth bulge will be centered at age 18. This trend will definitely increase the pressure on university and college places, and on jobs, housing, and training facilities. Given that the quality of those new entrants to the labor market is likely to be higher than that of their predecessors, their expectations will also be higher.

Two unexpected trends are impacting the labor market in Jordan. First, there is a growing tendency for young Jordanian males to end their schooling at the end of their secondary education instead of continuing on to higher education. Just under sixty percent of employed male youth (15-29) in 2006 had only basic or elementary education, up from 50% in 1995. The second largest group of male entrants is made up of those with secondary education, about 20% in 2006. Secondly, there is a pronounced and apparently accelerating decline in male participation rates at relatively early ages, a trend that does not conform to international experience.

Human Resources Development is at the top of the national agenda in Jordan. Major reforms of general and higher education started several years ago and a new reform program will start soon in employment and the Technical and Vocational Education and Training sectors. Jordan realizes that the competitiveness of its human resources is the gateway to the world of the Direct Foreign Investment and the solution to the economic and social changes the country faces.

This study is one of a series that the Al Manar project at NCHRD has produced that tackle the major challenges confronting HRD. As with the other studies, this one will be disseminated widely and shared with policy makers throughout the nation. Special thanks are due to the two researchers, Dr. Raugi Assaad and Ms Mona Amer, for their distinguished expertise, analytical skills and dedication in producing this study.

**Dr. Nader Mryyan,**

## Executive Summary

This report uses existing statistical data sources in Jordan to examine developments in labor supply, labor demand, and wages in the Jordanian labor market over the 1995-2006 period. With the exception of one or two years, the period under consideration has been characterized by rising growth rates of GDP, which reached 7.5 percent per annum in 2004. Despite this healthy growth outlook, unemployment remained persistently high at around 14 percent and real wages remained fairly constant for Jordanians in the private sector and fluctuated in the public sector. This report will try to elucidate these trends by examining trends in labor supply and demand over the 1995-2006 period.

On the labor supply side, Jordan's working age population has been growing quite rapidly at about 3.2 percent per annum and is about to grow even faster as the youth bulge generation now centered at around age 13 enters working age in the next decade. Those currently entering the Jordanian labor market are not only more numerous, but also more educated. After a period of relative stagnation in the average years of schooling at about 11 years of schooling per person, mean years of schooling for those born since 1978 are beginning to climb again, especially among young women. Because education tends to raise a new entrant's labor market expectations in terms of job quality and stability, increased education has led to lengthier job search and, in turn contributed to the persistence of high unemployment rates.

Despite rapid growth of the working age population, the growth of the labor force itself has been somewhat attenuated in recent years by falling participation rates among both males and females. In particular, there is a noticeable downward trend in participation among males older than forty years of age, especially in rural areas. With rising rates of educational attainment, female participation rates would have been expected to increase, but lower participation among educated females who are no longer able to obtain government employment has put a lid on the growth of female participation. There is some evidence that young Jordanian males are increasingly more likely to end their schooling at age 18, at the end of the secondary stage, rather than continue onto university. At the same time, young women seem to be pursuing post-secondary education at higher rates. The rate at which young women remain in higher education through age 21 is also rising more rapidly than for young men, suggesting a decline in two-year post-secondary degrees for women in favor of four-year degrees. As a result of these opposing trends by gender, the distribution of young male new entrants by educational level has changed very little in recent years, with nearly 60 percent having only a basic education and 20 percent a secondary education. In contrast, the distribution of young female new entrants shows a significant rise in the proportion of those with university education as well as those with basic education, and a decline in those with intermediate post-secondary diplomas.

The Jordanian labor supply has been supplemented in important ways in recent years by a growing flow of foreigners into the country. Although stock of foreign workers is not fully captured by existing statistical sources, we made an attempt to estimate the stock of foreign workers in Jordan by combining data from the 1994 and 2004 population censuses with data from the foreign worker

registration system. We thus estimate the number of foreign workers in Jordan to be approximately 300 thousand workers in 2006. This figure excludes most of the Iraqi refugees who arrived in Jordan since 2004 who may be working. A recent report by Fafo and UNFPA estimates the number of Iraqis in Jordan in May 2007 at 450-500 thousand.

Reflecting the more rapid rates of economic growth, employment growth accelerated significantly in the 2002-2006 period in Jordan as compared to the 1999-2002 period. Nevertheless, Jordanian workers benefited only partially from this acceleration of growth, due to the large influx of foreign workers that occurred during this period to meet the increased demand. Although the growth of overall employment in Jordan increased from 2.1 percent p.a. in 1999-2002 to 5.2 percent p.a. in 2002-2006, employment growth among Jordanians was much lower at 1.6 percent p.a. and 2.8 percent p.a., respectively. Of the 22 thousand jobs created by the economy, on average, in the 1999-2002 period, 37 percent went to non-Jordanians. With the acceleration of job growth to 55 thousand jobs p.a. in the 2002-2006 period, more than half the job growth (53%) went to foreign workers. The growing role of foreign labor in the Jordanian economy probably explains the declining share of private sector employment among Jordanians. That share had risen from 1999 to 2001, but the trend was reversed thereafter. The Jordanian private sector continued to grow, but was increasingly relying on foreign workers to meet its labor needs.

Trends in labor demand by establishment size show that the share of micro enterprise in total employment has risen from 2000 to 2003 and that of large enterprises (50+ workers) has declined. Besides micro enterprise, another enterprise segment that has grown rapidly is medium enterprises with 20 to 49 workers.

Economic growth in Jordan in the 1999-2002 period was concentrated in manufacturing, construction, trade, and finance and insurance. Accordingly, employment in these industries grew faster than average during this period. In the 2002-2006 period, value added growth in manufacturing and construction slowed a little, but were still growing faster than average, trade speeded up and the tourism industry, as represented by restaurants and hotels, made a significant recovery after a period of sharp decline. Significant accelerations of value added growth during this period were also observed in transport, storage and communications and in real estate and business services. The 2002-2006 pattern of growth resulted in rapid employment growth in agriculture, mining, utilities, construction, restaurants and hotels, finance and insurance, public administration and domestic service. However, Jordanians managed to capitalize on the growth of only a subset of these industries, and there was large-scale substitution of foreign workers for Jordanians in other industries. The employment of Jordanians grew in public utilities, restaurants and hotels, finance and insurance and public administration, whereas the increased demand for labor was met by foreign workers in agriculture, mining, construction, and domestic service.

On the occupational front, the largest category in 1999 – craft and related workers – maintained its share of total employment at about 18 percent, but was overtaken by elementary occupations, which increased its share from 17 percent in 1999 to 25 percent in 2006. Professionals, the third largest category, expanded from 11.5 percent in 1999 to 16 percent in 2006. The category experiencing the greatest relative decline is agricultural workers, which now constitutes less than 4 percent of total employment. Among women the largest category – professionals – increased from

28 percent of employment in 1999 to 45 percent in 2006. This was at the expense of the second largest category – technicians and associated professionals – which declined from 35 percent to 27 percent. The evolution of the occupational pattern of labor demand in Jordan is thus increasingly skewed toward professionals, and away from agricultural work. A similar contrast exists between domestic and foreign workers on the occupational front as with economic activity. Domestic workers benefited from the growth in demand for professionals whereas the increased demand for unskilled workers in elementary occupations was essentially met by increased reliance on foreign labor.

A comparison of labor market indicators across the 2003 and 2005 EUS and the 2004 Population census reveals considerable similarity in terms of the measurement of the employed population, but significant divergence in the measurement of unemployment. In our judgment, the lower estimate of unemployment provided by the EUS is more reliable. Unemployment is a complex concept requiring several criteria to be met for a person to be considered unemployed according to international definitions, as opposed to simply not working. It is usually difficult to correctly apply these criteria in a very large-scale data collection operation such as the census, leading to the possible overestimation of unemployment.

Finally, the report tackles the evolution of wages in the Jordanian economy. The main conclusions from the analysis of wage trends is that private sector wages rose slightly faster than wages in the public sector in the previous decade, although they still remain lower on average. Wages for foreign nationals in the private sector rose even faster although they started at an even lower base. Wages for men in the private sector rose faster than for women, but the difference in trends was not large. The largest increase in wages in the 1994-98 period occurred in the health and social services industry, followed by mining and quarrying, and restaurant and hotels. In the 2000-03 period, the largest increases were in restaurants and hotels, other community, personal and social services, transport storage and communications, and construction. In terms of occupations, wages rose the most among senior officials and elementary occupations in 1994-98 and among services and sales workers and elementary occupations in 2000-03. The wage increases among elementary occupations reflects the increased demand for this type of unskilled work during the 1999-2006 period. However, the increased employment of professionals was not accompanied by significant increases in wages probably because it was accompanied by increased supply as well. Overall, the observed wage trends underscore the dynamism of Jordan's service economy, especially the tourism sector, in recent years.

## Introduction

This report uses existing statistical data sources in Jordan to examine developments in labor supply, labor demand, and wages in the Jordanian labor market over the 1995-2006 period. It comes at the heels of a major World Bank report on the Jordanian labor market (World Bank 2007), which has identified a major paradox in the Jordanian economy, namely the co-existence of high economic growth and persistently high unemployment. Despite the fact that Jordan's GDP growth rate has averaged 7.2 percent per annum from 2002 to 2006, Jordan's unemployment rate has remained persistently high at around 14-15 percent. The World Bank report attributes this paradox to the existence of three mismatches in the Jordanian labor market, namely geography, employability, and expectations in the context of a fairly open labor market where employers can easily meet their employment needs by hiring foreign workers. In this context, the low opinion of employers of the employability of Jordanian workers, including their willingness to work hard, put in long hours, and be flexible, collides with the high expectations of Jordanian youth whose increasing levels of education lead them to expect well-paying desk jobs, close to home. The high unemployment rate is compounded by a high non-participation rate by international standard, even among prime age men, whose rates of non-participation in the labor market have been increasing in recent years.

Although this report will attempt to shed light on trends in labor supply and demand in the Jordanian economy over the previous decade, unemployment is not covered extensively because it has already been covered in depth in other studies (See for instance ETF 2005 and World Bank 2007). However, we do compare the results of the 2004 Population Census and the Employment and Unemployment Surveys (EUS) of 2003 and 2005 with regards to labor force participation rates and unemployment rates.

Despite the fairly open nature of the Jordanian labor market, Jordanian labor statistics do a poor job capturing the inflows of foreign workers and the outflow of Jordanian workers abroad. Neither the household-based Employment and Unemployment Survey (EUS) nor the establishment-based Employment Survey (ES) are able to capture the size and characteristics of foreign workers working in Jordan. Based on administrative sources, the World Bank estimates the number of foreign workers in Jordan to be somewhere between the officially registered 250 thousand workers in 2005 and 300 thousand, but also cites a high unofficial estimate of 600 thousand (World Bank 2007, p. 4). The Employment and Unemployment Survey of 2006 puts the total number of foreigners in Jordan at 546 thousand, of whom approximately 40 percent, or 215 thousand, are working. They thus constitute, according to this estimate, approximately 18 percent of the Jordanian labor force. These figures become even less certain in the context of the large inflow of Iraqi refugees into Jordan in recent years. The important role of foreign labor in the Jordanian economy is even more apparent when one considers the proportion of new job creation taken up by foreign workers. The World Bank report estimates that of the 49,000 new jobs created per year, on average, from 2001 to 2005, 58 percent went to non-Jordanians (World Bank 2007, p ii). Thus Jordan's increasing reliance on foreign workers to meet its labor needs is coming at a time of a rapidly growing working age population that is, however, less engaged in employment due to increasing unemployment and declining participation rates.

The report consists of four chapters. Chapter 1 examines labor supply issues in Jordan, including demographic trends, labor force participation and the educational and age compositions of the labor force. Chapter 2 examines labor demand trends in Jordan including the compositional shifts in the economy in terms of sector of ownership, establishment size distributions, sector of economic activity, and occupation. Chapter 3 compares the results of the 2004 Population Census and the EUS for 2003 and 2005 with regards to labor force participation, employment and unemployment. Chapter 4 assesses wage trends in the Jordanian economy by constructing wage indices by sector of ownership, economic activity, and occupation.

# **Chapter 1: Labor Force Participation and Characteristics of Labor Supply in Jordan: 1995-2006**

## **1.1 Introduction**

This chapter analyzes the main characteristics of labor supply in Jordan and its evolution during the last decade (1995-2006). It is based on the micro data of the annual Employment and Unemployment Surveys (EUS) carried out by the Jordanian Department of Statistics (DOS).

Jordan's working age population is growing quite rapidly and is on the verge of growing even more rapidly as the large "youth bulge" generation makes its way to the labor market over the next decade. The largest cohort of Jordanians in 2006 was centered around the age of 12-13. This cohort will lead to unprecedented growth of the domestic working age population over the next decade. The younger cohorts are getting smaller in both relative and absolute terms, reflecting the decline in fertility that has occurred in Jordan in recent years. Those currently entering the labor market in Jordan are not only more numerous relative to previous cohorts, but are also more educated. After a period of relative stagnation in the average years of schooling at about 11 years for Jordanians born from 1965 to 1978, mean years of schooling are starting to increase again for those born since 1978, especially among Jordanian women.

Although the working age population in Jordan is growing fairly rapidly, the growth of the labor force has been attenuated in recent years by falling participation rates, among both males and females. While female participation rates are increasing in rural areas from their very low initial levels, there is a significant trend of declining participation among prime-working age and older males in rural areas, particularly among those with lower levels of education. Although participation rates increase with education for females, participation rates among educated females are declining over time, countering the compositional effect of increased education on participation. The declining participation trend among educated females can probably be attributed to the reduction in work opportunities in the government, which has traditionally been the primary source of employment for educated women.

This chapter is divided into three additional sections. The first briefly presents how the EUS data have been prepared in order to create a common data file for the period of analysis (1995-2006). The second section examines the Jordanian demographic trends focusing on the evolution of the population by age group and educational attainment over time by gender and urban/rural location. It also discusses the size and geographic distribution of the foreign population in Jordan. The evolution of the labor force and its composition by gender, urban/rural, age group and educational attainment are presented in the third section.

## **1.2 Data Preparation**

This chapter is based on the pooled annual data of the Employment and Unemployment Surveys (EUS) collected by the Jordanian Department of Statistics from 1995 to 2006. EUS 2004 is excluded from the analysis as it was carried out the same year as the population census and appears not to be comparable with the other years of the survey.

### *Scope of the surveys*

The EUS is a household survey that gathers information on individual social characteristics (gender, age, marital status, relation to the head of household, nationality, educational attainment) and detailed information on the individual employment status (employment, unemployment, inactivity). For those who are currently employed, the economic activity, economic sector and occupation are given. For those not working, but desiring to work, the survey collects information on search methods and duration of unemployment spells. The reason for being out of the labor force (retired, studying, other reasons) is also provided.

### *Creation of a common data file*

All EUS micro data were appended in one data file using a common and unique individual identification code that is based on the survey year and round, the household geographical location (governorate, district, sub district...) and the individual code within each household. The definition of variables and codes were checked and were given a unique name for all years. A list of the common variables in each round of the survey is shown in Annex 29.

### *Accounting for the Undercounting of Non-Jordanians in the EUS*

The EUS is known to understate the number of non-Jordanian workers as compared to the Ministry's of Labor national registration system for foreign workers and to the Population Census. To correct for this underestimation, we derive a set of separate weights for five nationality groups derived from the 1994 and 2004 population censuses and, in the case of some nationalities, from the national foreign worker registration system. The six nationality groups for which separate weights are computed are Jordanians, Egyptians, Syrians, Iraqis, other Arabs, and non-Arabs. The annual weights are based on extrapolations of the population of each of these nationality groups from 1994 to 2004 and a projection to 2006, keeping each group's growth rate constant. The figures for the total number of workers obtained using this method were lower than those registered in the national foreign worker registration system for Egyptians from 2000 to 2006 and for non-Arabs from 2004 to 2006. In those two cases, we took the higher figure of registered workers and the population of Egyptian and non-Arabs was estimated using the employment to population ratio for Egyptians and non-Arabs derived from the EUS. This method allowed us to derive a set of population estimates for each of the non-Jordanian groups. These were combined with annual Population estimates for Jordanians provided by the Department of Statistics to obtain appropriate weights for the six nationality groups. These figures understate the number of Iraqis in Jordan in 2005 and 2006 by a wide margin, since the major inflow of Iraqi refugees to Jordan was not fully captured by the 2004 population census. A recent report by Fafo and UNFPA estimates the number of Iraqi residents in Jordan as of May 2007 at between 450,000 and 500,000 (Fafo and UNFPA 2007). Although we discuss the implications of the findings of this report in the sequel, we refrained from changing the figures we provide for non-Jordanians to match these estimates.

## 1.3 Demographic Trend

### 1.3.1 Population trend

According to the population estimates provided by the Department of Statistics, the Jordanian population grew from 3.9 million in 1995 to 5.1 million in 2006, an average rate of growth of 2.4 percent per annum (See Annex Table 1). Based on the methodology we describe above, we estimate that the non-Jordanian population residing in Jordan grew from 0.32 million in 1995 to 0.69 million in 2006, an annual rate of growth of 7 percent per annum. The fastest rates of growth were among Egyptians and non-Arabs, who each grew at about 10 percent per annum, on average (See Annex Table 3). These estimates do not include the influx of large numbers of Iraqis refugees in Jordan following the invasion of Iraq in 2003. As mentioned above, Fafo/UNFPA place the number of Iraqis in Jordan in May 2007 at 450 to 500 thousand.

As shown in Figure 1.1, the distribution of Jordanians by governorate shows that they are concentrated in three governorates where 70% of total Jordanian population resided in 2006. These are: Amman (37.2%), Irbid (18.2%) and Zarqa (15.0%). There was almost no change in the geographical distribution of the population by governorate over the period 1995-2006.

Figure 1.1

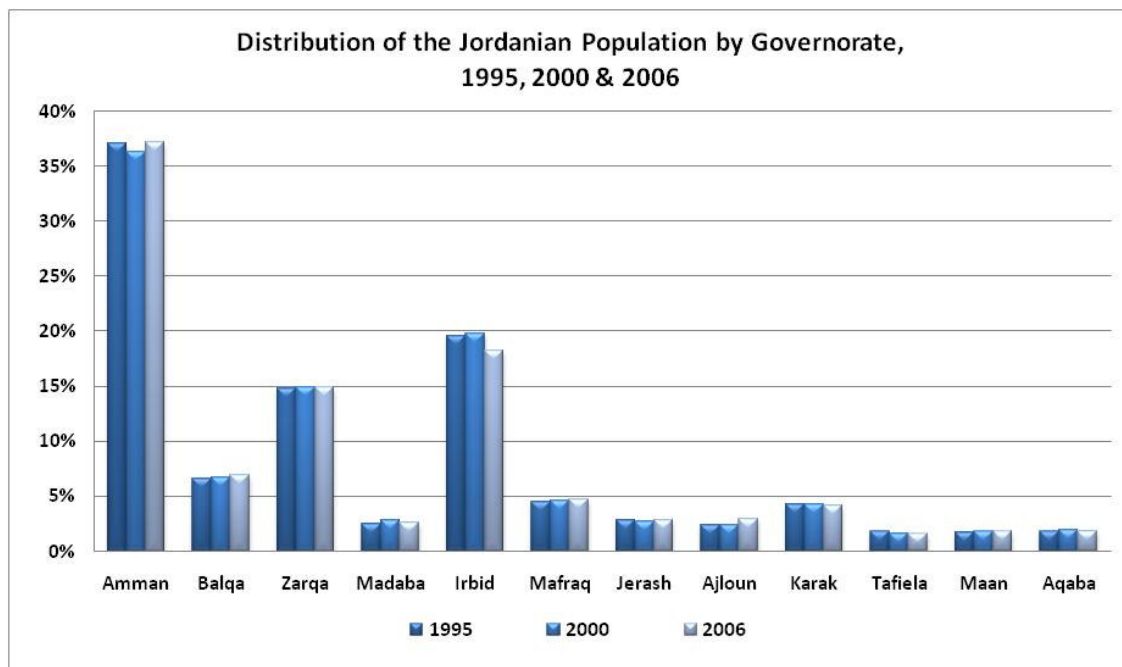

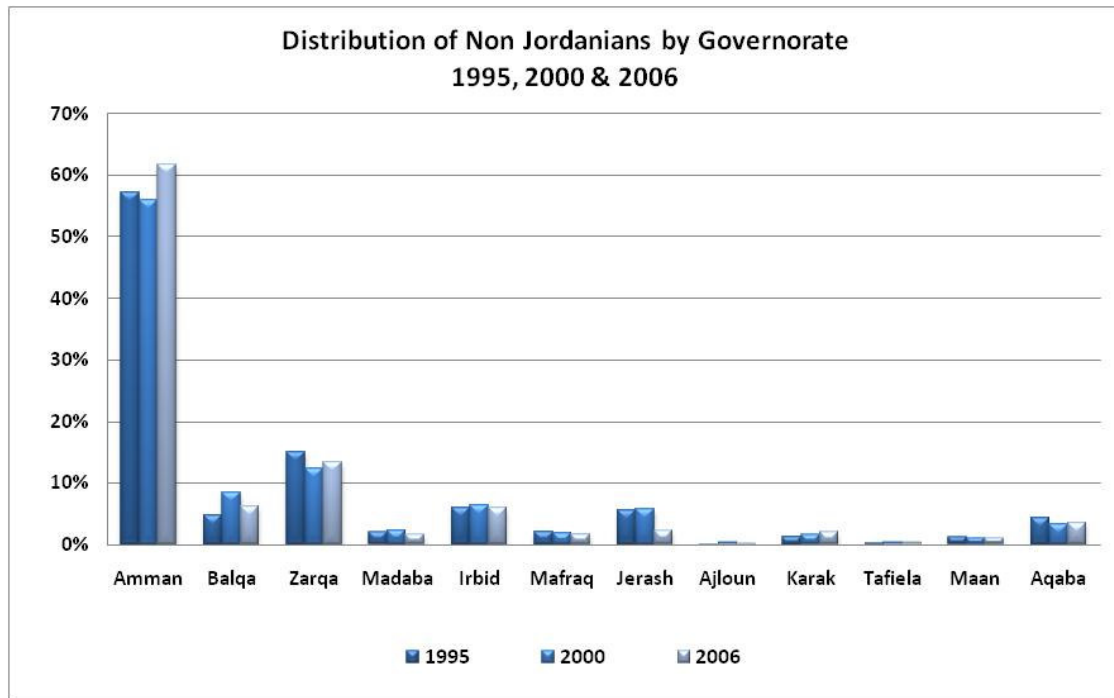

Figure 1.2 presents the geographical distribution of foreigners in 1995, 2000 and 2006. It reveals that foreigners are even more concentrated geographically than Jordanians. In 2006, Amman by itself had almost the two-thirds and Zarqa an additional 13.5%. Over the period 1995-2006, the proportion of foreigners residing in Amman went up from 57.3% to 61.7%, while it sharply declined in Jerash governorate (from 5.6% to 2.2%). It remained stable in other regions.

Figure 1.2

The distribution of foreigners by nationality, based on the estimates we undertook as described above, is shown in Figure 1.3. Putting aside the possible underestimation of Iraqis, Egyptians are the most numerous, followed by other Arabs, and non-Arabs. We estimate that there are now over 350 thousand Egyptians in Jordan in 2006, 139 thousand other Arabs, and 99 thousand non-Arabs (See Annex Table 1). The proportion of Egyptians increased from under 40 percent in 1995 to over 52 percent in 2006. The proportions of all other nationalities have declined since 1995 except for the non-Arabs, whose proportion increased slightly. According to the Fafu/UNFPA report 79 percent of the approximately half million Iraqis in Jordan in 2007 are in the Amman area (Fafu and UNFPA 2007, Table 1.).

Figure 1.3

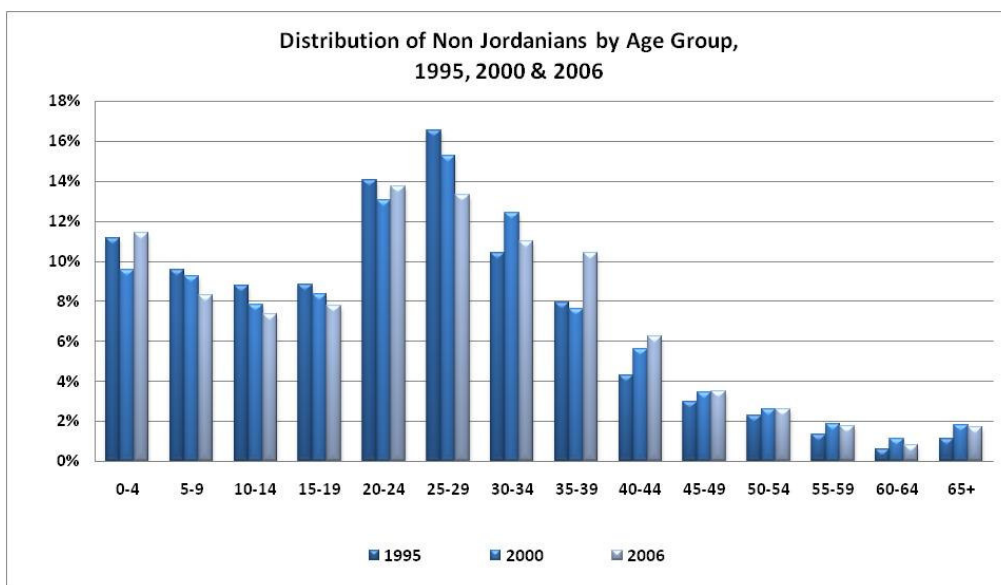

Figure 1.4 presents the distribution of resident foreigners by age group. It shows that approximately one third (38.1%) are aged between 20 and 34 years of age and almost one half (48.5%) are age between 20 and 39 years of age. On average, non Jordanians are older than their Jordanian counterparts reflecting the fact that foreigners residing in Jordan are there mostly for work purposes. Again this does not includes most of the Iraqis who arrived since the 2004 Census was carried out.

Figure 1.4

### 1.3.2 Age distribution of the Jordanian population

Figures 1.5a and 1.5b present the distribution of the Jordanian population by age group in urban and rural areas in 1995, 2000 and 2006. First, the Jordanian population is characterized by its relative youth. Indeed, in 2006, 36.8% were under the age of 15 and 59.2% under the age of 25. Because of higher fertility rates in rural areas, the rural population has a younger age profile than the urban population, with 61.9% under the age of 25, compared to 58.8% in urban areas. Second, Figures 1.5a and 1.5b show that a major change occurred in the age composition of the Jordanian population over the period 1995-2006. The proportion of youth (under age 19) is decreasing while the share of the older age groups are either remaining stable or increasing. The proportion of youth is decreasing at higher rates in rural than in urban areas. For example, over the period 1995-2000, the proportion of those aged 0-14 decreased by 2.7% per year in rural areas compared to 1.4% per year in urban areas. The same is true for the period 2000-2006. The share of those aged less than 15 declined by 1.4 % per year in rural areas, it declined by 1.1% in urban areas. However, the decline in the share of those under 15 and those under 25 did not yet translate into smaller cohorts of youth as the number of people less than 15 and less than 25 has continued to grow between 1995 and 2006. For instance, the size of the age group 0-14 increased from 2.54 million in 1995 to 2.99 million in 2006 (see Annex Table 4). The largest five-year age cohort in both urban and rural areas is now the 10-14 year olds. This “bulge” will be reaching working age over the next decade, leading to increasing pressure on labor supply.

Figure 1.5a

Figure 1.5b

Figures 1.6a and 1.6b show the continuous age distribution of the Jordanian population in urban and rural areas by single year of age in 1995, 2000 and 2006. In urban areas, the 1995, the mode of the distribution centered around age 2. The mode shifted to age 7 in 2000 and to age of 13 in 2006. In rural areas, the shape of the age distribution is flatter, especially in 1995 and 2006 where the proportion of children aged 3 to 14 is very large.

Jordan therefore is at the early stages of a youth bulge, which will begin to sharply increase the supply of young workers to the labor market over the next decade. By 2011, the youth bulge will be centered at age 18, the age at which many secondary school graduates enter the labor market. For instance, the number of 15-19 year olds, many of whom will be entering the labor market in the next five years, is 16 percent higher in 2006 than the 20-24 year olds who are currently making their way into the labor market.

Figure 1.6a

Figure 1.6b

### *1.3.3 Trend in the Educational Attainment of the Jordanian Population*

Figures 1.7a and 1.7b present the average number of years of education by birth cohort among males and females and by urban/rural location for those born between 1930 and 1980, and therefore are expected to have completed their education. First, this figure reveals very important increases in the average years of education over time for both males and females and in both urban and rural areas. For instance, male average years of education in urban areas went up from 6.3 years for those born in 1930 to 11.3 years for those born in 1980. It grew very rapidly for those born between 1930 and 1960 and then the pace of growth slowed for those born between 1960 and 1980. Another striking observation is the fact that gender and urban/rural disparities disappeared over time. Among older cohorts, the average years of education among rural and female Jordanians were lower than among their urban and males counterparts. For example, on average, rural females born in 1930 spent 4.5 years in school compared to 6.6 years for urban males born that same year. And among the youngest cohort, the average years of education has reached approximately 11 years, for both males and females, in both urban and rural areas. Indeed, the average years of schooling for urban females has exceeded that of urban males, starting at about the 1970 birth cohort, and a similar trend are starting to occur in rural areas.

Based on data from the cohorts born from 1975 to 1980, there is some evidence that the increase in educational attainment is starting to accelerate again. This is especially true for urban females, whose mean years of schooling had reached nearly 12 for those born in 1980. This significant increase in the stock of female human capital in Jordan contrasts sharply with the low and possibly declining female participation rates. Educated women are emerging as a valuable albeit highly underutilized economic resource in Jordan.

Figure 1.7b

## 1.4 Labor Force

### 1.4.1 Trends in Labor Force Growth

This report distinguishes between two labor force definitions. The first one or standard definition comprises those employed and those unemployed that are not working, available for work and searching for a job. The second definition or broad definition includes the latter, plus the discouraged unemployed, the non-employed who desire and are available for work, but have not actively searched for it. The standard definition is available for the whole study period (1995-2006) but the broad definition is only available for years 2000 to 2006.

As shown in Table 1.1, the Jordanian labor force (nationals only), according to the standard definition, grew from 0.83 million in 1995 to 1.02 million in 2000, at the very rapid rate of 4.2% per annum. By 2006, it had reached 1.18 million, which represents a deceleration in the rate of growth to 2.5 percent per annum over the 2000-2006 period. Figures 1.8a and 1.8b show the trend in the size of the Jordanian labor force by gender and urban/rural location among those aged 15-64 using the standard and broad definitions, respectively. The figures reveal clear gender disparities. Indeed, in 2006, about a million males are active compared to only 183 thousand females (see Table 1.1). The male labor force is also growing more rapidly than that of females, despite the faster accumulation of education among females.

While overall the growth of the labor force appears to be slowing, it is accelerating in urban areas and decelerating sharply, if not declining in absolute terms in rural areas. In urban areas, the growth

accelerated, from 3.4 percent per annum to 4.3 percent per annum, with the accelerating trend affecting both males and females. In rural areas, there was an absolute decline in the labor force in the 2000-2006 period.<sup>1</sup>

Figure 1.8a

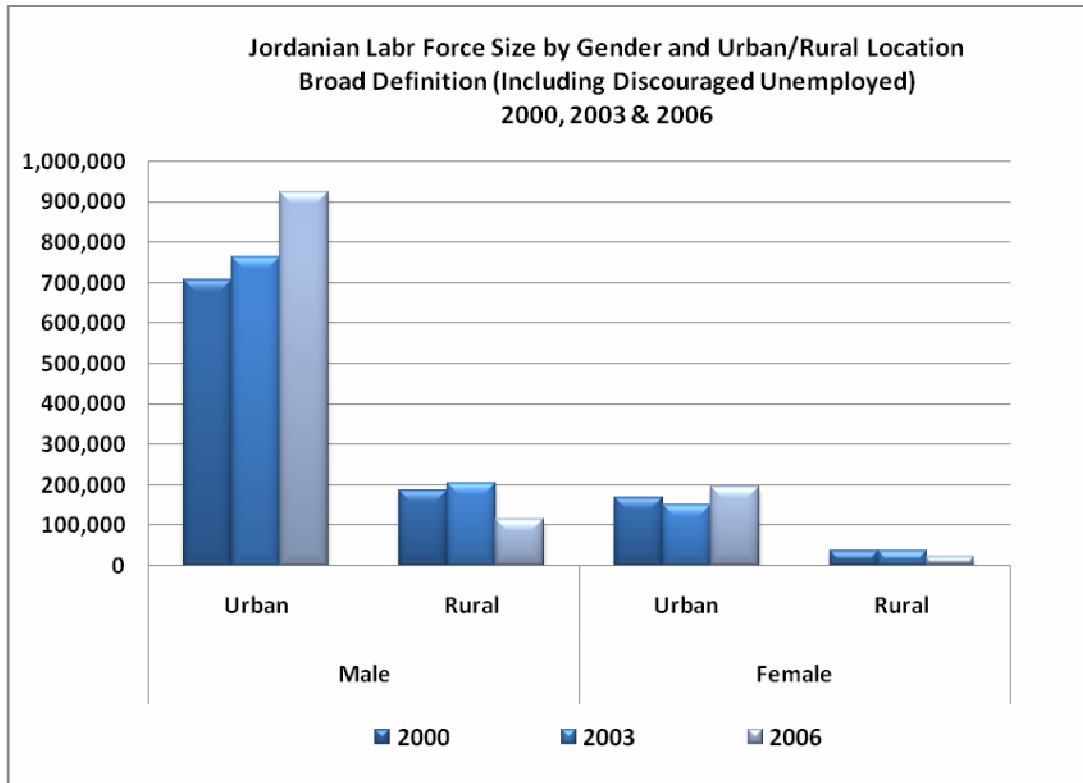

While the number of economically active men is almost not affected by the definition used, the size of the female labor force differs slightly. For example, in 2006, 183,434 women were active according to the standard definition while 216,089 were active according to the broad definition. The rate of the growth of the broad labor force for females is lower than that of the standard labor force, suggesting that the number of female discouraged unemployed is growing more slowly than the labor force.

<sup>1</sup> This finding needs to be checked more carefully. There may have been some administrative changes in the urban and rural classification in 2006 that resulted in this apparent decline.

Table 1.1: Jordanian Labor Force Size by Gender, Urban/rural Location (standard and broad definitions)

| Standard Definition |         |         |         |                               | Broad Definition             |       |         |         |                              |

Figure 1.8b

In the following sections, the analysis is limited to the standard definition of the labor force.

### 1.4.2 Labor Force Participation

The trend of labor force participation is given in Table 1.2. The first thing to note is the relatively low overall Jordanian labor force participation, at 39.7% of the working age population in 2006, primarily due to a very low female labor force participation rate (12.4%), but also a relatively low male rate by international standards (66.7%). Second, overall participation decreased slightly from 40.4% in 1995 to 39.7% in 2006. This is a reflection of a decline of both male and female participation rates over that period. However, male participation rates declined more rapidly, from 69.8% to 66.7%, compared to female rates, which went from 12.8% to 12.4%. These trends are present in both urban and rural areas. Female participation decreased in urban areas while it slightly increased in rural areas. Urban participation rates continue to be higher than rural rates for both males and females, but the gap is shrinking.

Table 1.2: Labor force participation (Ages 15-64) by gender, Urban/rural location – standard definition (in percent)

|        |       | 1995 | 2000 | 2006 |
|--------|-------|------|------|------|
| Male   | Urban | 70.7 | 69.7 | 67.1 |
|        | Rural | 65.8 | 66.5 | 63.4 |
|        | Total | 69.8 | 69.0 | 66.7 |
| Female | Urban | 13.6 | 13.7 | 12.6 |
|        | Rural | 9.6  | 10.5 | 10.7 |
|        | Total | 12.8 | 13.0 | 12.4 |
| Total  | Urban | 41.8 | 41.8 | 40.1 |
|        | Rural | 34.7 | 38.8 | 37.2 |
|        | Total | 40.4 | 41.1 | 39.7 |

### 1.4.3 Labor Force Participation by Age

Figures 1.9a and 1.9b present male and female participation according to age in both urban and rural areas in 1995, 2000 and 2006. They give further insight into the decline in male and female participation observed in the previous section.

As expected, male participation increases with age, reaching almost universal participation (91% and above) among those aged 27-34, and then it begins declining again. While the decline is slow for men over 35 in urban areas it is sharper in rural areas. The trend over time reveals that male participation has been declining among those aged 45 and above in urban areas. In rural areas, the decline in male participation over time starts as early as age 35.

This early decline in male participation at a fairly early ages and its increasing trend over time observed in Jordan is quite pronounced and does not conform to international trends.

This is an issue that warrants further investigation. It could be related to a trend toward earlier retirement from the military, whose recruits might be concentrated in rural areas. It is probably the most significant development in the evolution of labor force participation in Jordan.

Female participation also increases with age reaching a peak at the age 30 (26.8 % in urban areas and of 20.9% in rural areas) and then declines sharply until the age of 64. This result reflects the fact that most women are married and have children by the age of 30 and find it difficult to reconcile domestic and employment responsibilities. However, in 2006, female participation increased slightly after the age of 40 in rural areas. The analysis of the trend of female participation by age shows that

female participation increased among young females (aged 20-32) in both urban and rural areas while it decreased among those aged 33 and above in urban areas.

#### ***1.4.4 Labor Force Participation by Educational Attainment***

Figures 1.10a and 1.10b illustrate male and female participation by educational level for years 1995, 2000 and 2006 among those aged 15-64.

Male participation by educational attainment shows that it is relatively low (below 60%) among holders of less than intermediate diplomas, except for the illiterates and those who read and write. This can easily be explained by the fact that many holders of less than intermediate education are still pursuing their education and thus are out of the labor force. Participation rates reach high levels (more than 80%) among intermediate diploma and university and above graduates.

Urban and rural males have a very similar pattern of participation by educational level.

Over the period 1995-2006, participation decreased for all educational levels except at preparatory and basic education and among vocational apprentices. The decline in participation is most pronounced among illiterate males and probably reflects the decline observed among older males in both urban and rural areas.

Figure 1.9 a

Figure 1.9 b

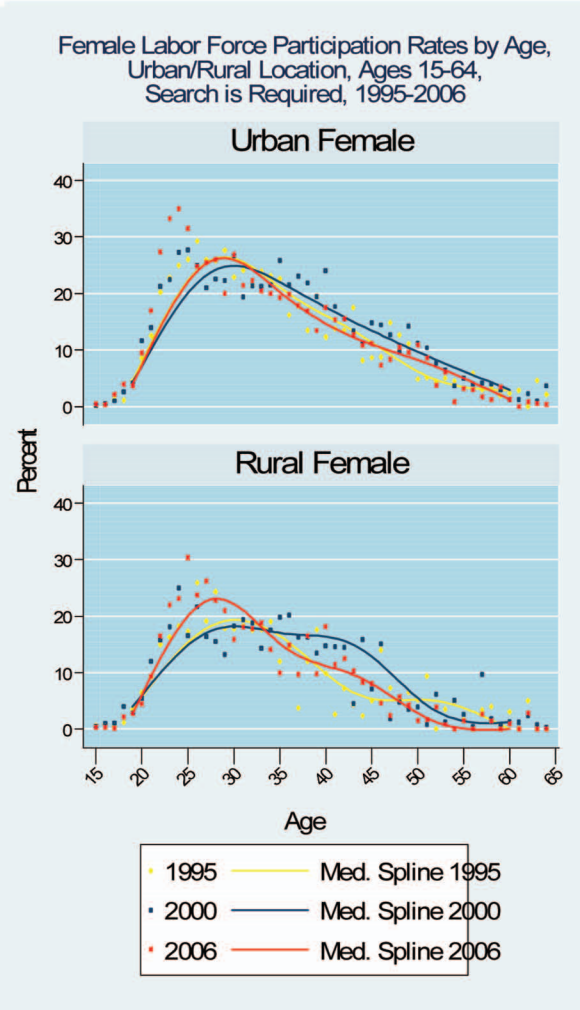

Figure 1.10a

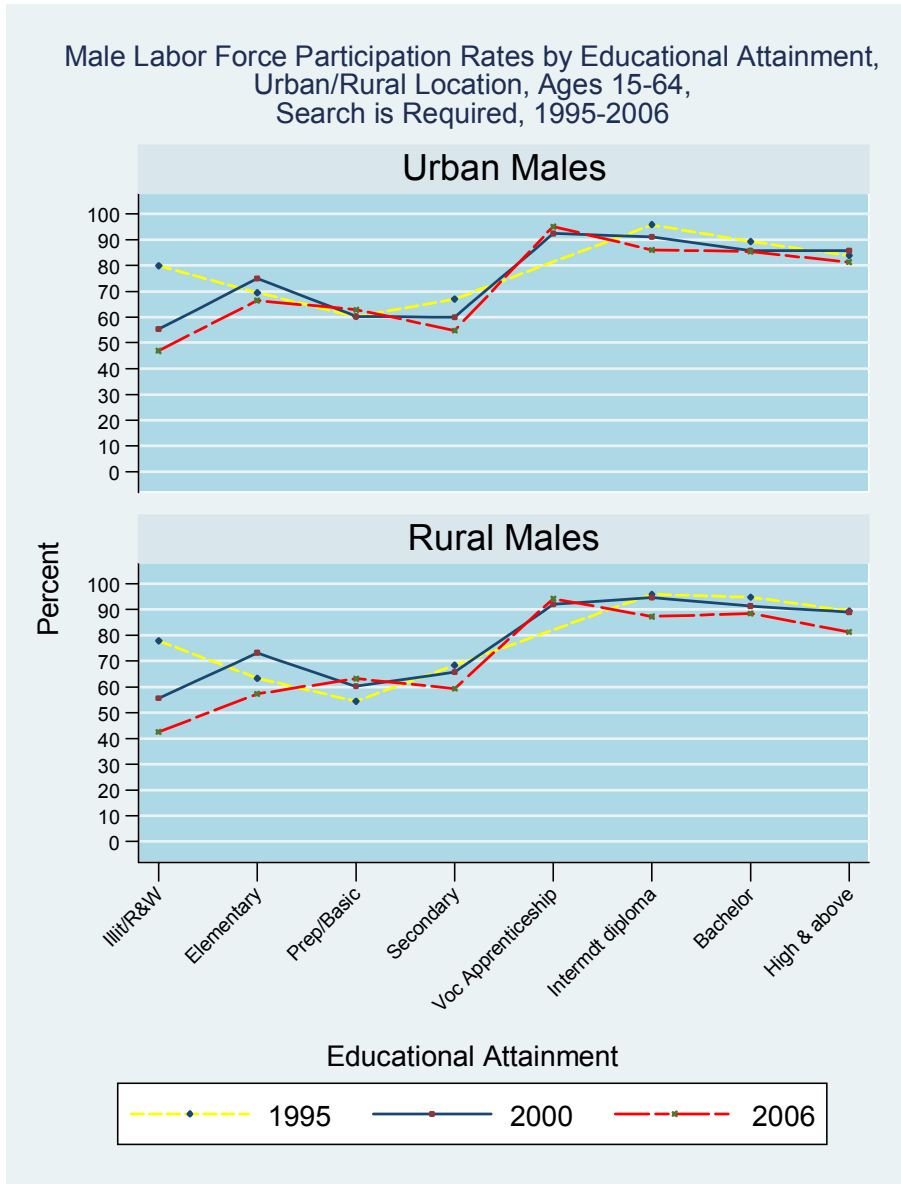

Figure 1.10b clearly shows the fundamental role education plays in female participation. Female labor force participation rates are very low (below 10%) among those with secondary education and below and then rise sharply with participation reaching a peak among those with post-graduates degrees (60% in urban areas and 80% in rural areas). However, while female participation rates remained stable at low levels of education, they decreased substantially among all post-secondary graduates between 1995 and 2006.<sup>2</sup> The decline is particularly sharp among vocational apprentices and intermediate diploma holders in both urban and rural areas. The decline may be due to the reduction of employment opportunities in the government in recent years, which is the primary form of employment for educated females.

Figure 1.10b

<sup>2</sup> The lower participation rates among higher diploma holders in rural areas in 1995 is probably a figment of the data since the sample size in that category in rural areas is quite small.

### 1.4.5 Trends in Timing of Leaving School and Going to Work

Figure 1.11 shows the proportion of those who are not in school and those who are working according to age, for males and females in 1995, 2000 and 2006. The gap between the two sets of curves represents those who left school but are either inactive or unemployed by age. The wider gap between the two sets of curves among women underscores the fact that a greater proportion of females are either inactive or unemployed compared to their males' counterparts.

Figure 1.11

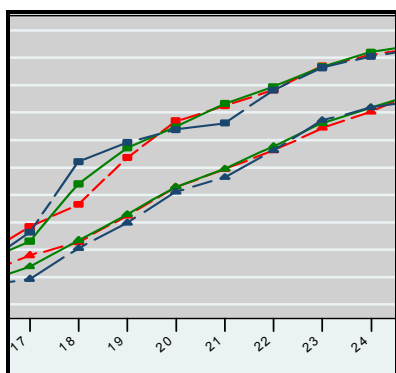

As expected the proportion of individuals leaving school increases with age. By age 15, less than 10 percent of males or females in Jordan had left school in any of the years under consideration. This underscores the high enrollment rates in basic education in Jordan. By age 18 over 50 percent of males had left school in 2006, which is a significant increase over those who had left by that age in 1995 and 2000 (See details of Figure 1.11 for young males in Figure 1.11a). This indicates a growing tendency for Jordanian males to end their schooling at the completion of their secondary certificates instead of continuing to higher education. Among females, the proportion of those who left school among 18 year olds in 2006 is lower than that of males, at about 42 percent. It has increased slightly from 1995 to 2006, but much more slowly than for males(See Details of Figure 1.11 for young

females in Figure 1.11b). This indicates that females in Jordan are more likely than males to go onto university education and increasingly so over time. The rate of those who left school by age 21 shows an opposite (declining) trend. It declines from over 72 percent in 1995 to 66 percent in 2006 for males, and from 78 percent to 62 percent for females. It shows that those who start higher education were more likely to stay until they completed a degree in 2006 than in 1995. It also shows that more young women than men remain in higher education till degree completion. By age 23, nearly 88 percent of young men and over 90 percent of young women had left school, indicating that slightly more men than women pursue post-graduate studies.

*Figure 1.11a Details of Figure 1.11 for Males 17-24*

*Figure 1.11b Details of Figure 1.11 for Females 17-24*

The timing of entry into work for early school leavers among males is almost immediately after leaving school. Thus early school leavers probably leave because of the need to work. By age 18, the gap between school leaving and starting work widens, indicating the tendency of secondary school graduates to spend some time in unemployment searching for an appropriate job. The gap between the ratio of those who left school and those who started work remains about constant for young men until age 25 or so. For men, this gap is almost entirely made up of unemployment and implies an unemployment duration of about 2-3 years. By age 26 the gap narrows significantly, and by age 30 the share of employed males reaches its maximum of about 90 percent.

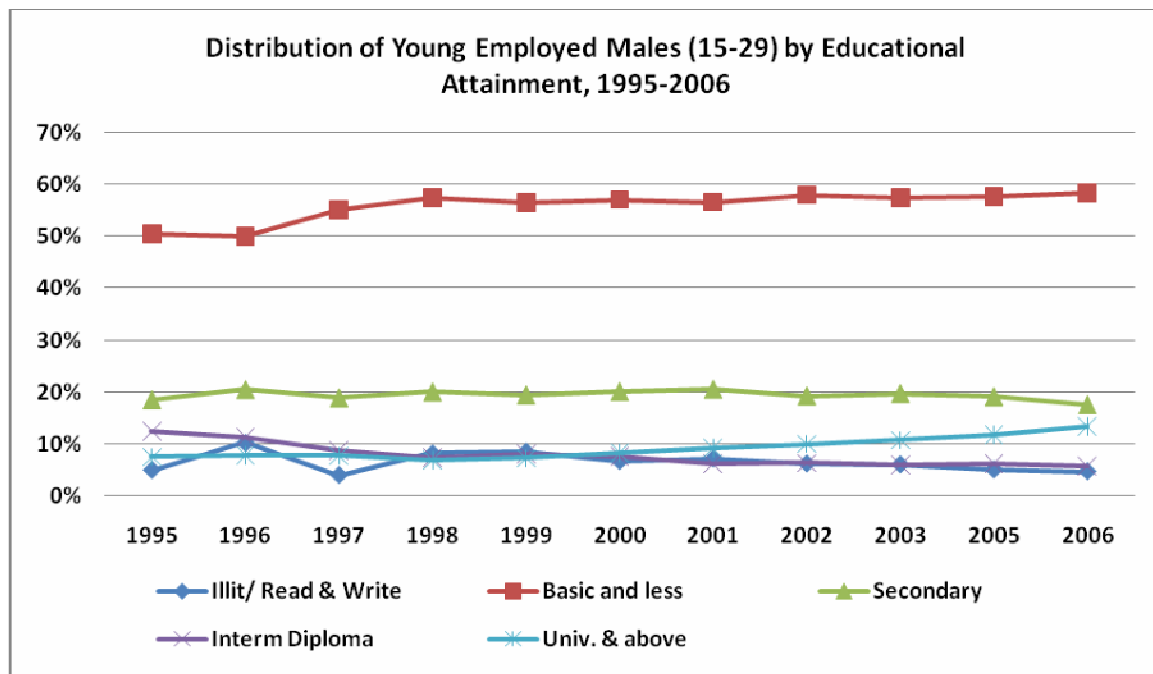

The timing of starting work is much later for young women. Until about age 19, nearly all young women who left school in Jordan are either inactive or unemployed. By age 20, the share beginning to work starts increasing steadily from about 5-7 percent at age 20, to a peak of 22 percent at age 24-25 in 2006. Female employment rates then fluctuate around this level until age 30, after which it declines below 20 percent. In 1995, the age pattern of employment for young women was a bit different. Employment rates were generally lower starting at age 20 and the peak employment rate was reached later, at age 26. In all years, the period of significant increase in employment for young women is the period from age 20 to 25, when most young women who are going to work, start entering into employment. Since employment rates persist at only slightly lower rates beyond the typical age of marriage in Jordan, it appears that only few of those women who opt to work leave the labor force upon marriage.

### 1.4.6 The Distribution of New Entrants by Educational Level

Figures 1.12a and 1.12b give an indication on the trend of new entrants' educational level over the period 1995-2006. As the EUS does not provide information on the first employment status or the age at entry into first employment, the educational attainment of new entrants is proxied here by that of employed youth (aged 15 to 29).

As shown in Figure 1.12a, the average educational attainment of employed young men has changed only slightly since 1995. Just under sixty percent of employed male youths in 2006 had basic or elementary education, up from 50 percent in 1995. The second largest group of male new entrants is made up of those with secondary education, who constitute 20 percent, with almost no change in their proportion since 1995. These are followed by those with university degrees and above, whose share has increase steadily from about 8 percent in 1998 to 13 percent in 2006. Finally, illiterates and those with intermediate degrees (two-year colleges or institutes) make up about 5 percent each and are on a downward trend. The main conclusion from this data is that the average educational attainment of employed new entrants in Jordan has not changed much over the past decade. This confirms the earlier finding that the average years of schooling has not changed much for men born between the years of 1960 and 1980, with the possible exception of the last couple of cohorts (See Figure 1.7a). The male labor market is thus increasingly dominated by males with basic education, with a slowly rising share of males with university education.

Figure 1.12a

Employed female new entrants in Jordan are significantly more educated than employed male new entrants, because employment is much more selective by education for females. However, despite significant changes in composition since 1995, it is still hard to say whether the average educational attainment of new female entrants has increased significantly. The two groups that are now dominating the female labor market are university graduates, whose share has increased from about

23 percent in 1995 to 32 percent in 2006, and basic and elementary graduates, whose share has increased from 23 percent in 1995 to 30 percent in 2006. The share of those with secondary and intermediate higher degrees has declined over time and that of illiterates has increased. Because employment among women is much more selective than among men, there is not a direct relationship between trends in education for all females, which has followed an upward trajectory and the trend in education among employed women. The mediating variable is the pattern of labor force participation by education. As we saw in Figure 1.10b, female labor force participation rises significantly with education, but there were significant declines in participation in recent years for educated women, leading the somewhat inconclusive trends observed among young workers.

Figure 1.12b

## 1.5 Conclusions

The foregoing analysis has shown that although Jordan's labor force growth has decelerated somewhat since 1995, Jordan is poised for another spurt of labor force growth as the largest cohort ever of young people makes its way into the labor market over the next decade. Even if recent declines in labor force participation persist at the current pace, the forthcoming increase in the size of the working age population will more than compensate for them, leading to an acceleration in the growth of the labor force. Although, rates of educational attainment had stagnated in recent years, especially among young men, there is some evidence that this stagnation might have ended and that future cohorts of labor market entrants will be more educated, and will thus aspire to a higher quality of jobs.

The major trend in male labor force participation is the decline in participation among older males, particularly in rural areas. Males as young as 40, many of them with low educational attainment, seem to be retiring early, and the trend seems to be increasing over time. The main trend in female participation is the declining participation among educated females. While overall female participation rates are stable or declining slightly, they should have in fact been rising due to the increased educational attainment of the female working age population. The primary reason for the lower participation rate among educated females is likely to be the reduced opportunities in the public sector that are perceived to be more compatible with women's domestic burdens. Given the women's educational attainment in Jordan is now higher than that of men, this reduced participation in economic activity among educated women appears to be a true lost opportunity for the Jordanian economy.

## Chapter 2: The Characteristics of Labor Demand in Jordan – 1995-2006

### 2.1 Introduction

This chapter aims at identifying the structure of labor demand in the Jordanian economy and the main changes that occurred in it since the mid nineties. It focuses on the trend of employment by nationality, sector of ownership, economic activity and occupation. The analysis is based on three data sources: the Employment and Unemployment Surveys (EUS) from 1995 to 2006<sup>3</sup>, the Establishment Surveys (ES) from 1994 to 2003<sup>4</sup> and the population Census of 2004<sup>5</sup>.

Although the EUS and ES do not fully cover sectors and jobs that employ foreign workers more intensively, we will use the information available on jobs held by foreigners as an indication of the pattern of employment for foreigners. It should be kept in mind however that this pattern could be distorted by the extent to which the jobs held by foreigners in the EUS and ES do not accurately reflect the universe of jobs held by foreigners in Jordan.

Due to apparent inconsistencies in the data sources in the 1995 to 1998 period, we limit most of our analysis in this chapter to the 1999-2006 period, during which the data appear to be more consistent. As shown in Figure 2.1, the 1999-2006 period saw an acceleration of GDP growth from just above 3 percent in 1999 to 8.5 percent in 2004, to settle at just over 6 percent in 2006. Thus, if we subdivide the period into two sub-periods, the 1999-2002 period had relatively slow growth, averaging 4.3 percent and the second period, 2002-2006, had relatively rapid growth averaging 6.5 percent. The period from 1995 to 1998, which we do not focus on due to data inconsistency, was an even slower growth period than the 1999-2002 period.

In accordance with the GDP growth data, data from the EUS, complemented by the population weights we estimated, indicates that employment growth in Jordan accelerated significantly in the period from 2002 to 2006 as compared to 1999 to 2002. The growth rate of overall employment increased from 2.1 percent per annum in the 1999-2002 period to 5.2 percent per annum in the 2002-2006 period. These growth rates translate into an average growth of 22 thousand jobs per year from 1999 to 2002 and 55 thousand jobs per year from 2002 to 2006 (See Figure 2.2). The acceleration of employment growth reflects the more rapid growth of GDP in the latter part of the period, but also the growing contribution of the public sector to employment creation after a period of contraction (see below).

---

<sup>3</sup> EUS 2004 is excluded from the analysis as it is not comparable to other EUS years. Appendix B presents the list of common variables for each survey of the ES from 1994 to 2003.

<sup>4</sup> ES 1999 is excluded from the analysis as it is not comparable to other ES years

<sup>5</sup> 10 percent sample of Census 2004.

Figure 2.1

Source: Jordanian Department of Statistics.

Nevertheless the rapid growth of employment in Jordan from 2002 to 2006 did not necessarily translate into an equally rapid growth of employment for Jordanians. Despite the fact that employment growth among nationals also accelerated from 1.6 percent from 1999 to 2002 to 2.7 percent from 2002 to 2006, a growing proportion of new jobs were being captured by non-Jordanians. As shown in Figure 2.2, the proportion of net new jobs captured by non-Jordanians increased from 37 percent in the 1999-2002 period to 53 percent in the 2002-2006 period.<sup>6</sup> Since nearly all foreigners working in Jordan work for the private sector, the rapid growth of job creation for foreigners could explain the stagnating share of private sector employment among Jordanians in recent years.

## 2.2 The Structure of Labor Demand by Sector of Ownership

As shown in Figure 2.3 below, the share of private sector employment for Jordanians in 2006 was 63 percent as compared to 96 percent for non-Jordanians. While the share of the private sector for non-Jordanians has remained fairly stable, that of Jordanians increased significantly from 1999 to 2001 and then began a slow decline from 2001 to 2006.<sup>7</sup> As shown in Table 2.2, the rising share of the private sector among Jordanians in the 1999-2002 period has to do with an absolute decline in public sector employment, at a rate of 2.7 percent per annum, at a time when private sector employment of Jordanians was growing at 4.2 percent per annum. The declining share of the private

<sup>6</sup> These estimates of the share of employment growth going to foreigners are consistent with those obtained by the World Bank in World Bank (2007).

<sup>7</sup> Because of hard to explain fluctuations in the data from 1995 to 1998, we opt to put less weight on the trend during this period.

sector in the total employment of Jordanians in the subsequent period (2002-2006) is linked to a reversal in the decline of public sector employment, which accelerated to a rate of 3.8 percent per annum and a deceleration in the growth of private employment among Jordanians. Overall, employment growth in the private sector accelerated to 6 percent per annum, but it significantly increased its reliance on foreign workers.

Figure 2.2

Source: Authors' calculations based on EUS data

Figure 2.3

Source: Authors' calculations based on EUS data

Thus the evidence available seems to indicate that the booming private sector economy in Jordan in the 2002-2006 period did not contribute as much would be expected to employment growth among Jordanians because of increasing reliance on foreign workers in that sector. The number of foreigners employed in the public sector also increased rapidly, but from a very low base.

Table 2.2: Employment Growth Rate by Nationality and Institutional Sector, Ages 15-64, 1999-2006 (in Percent)

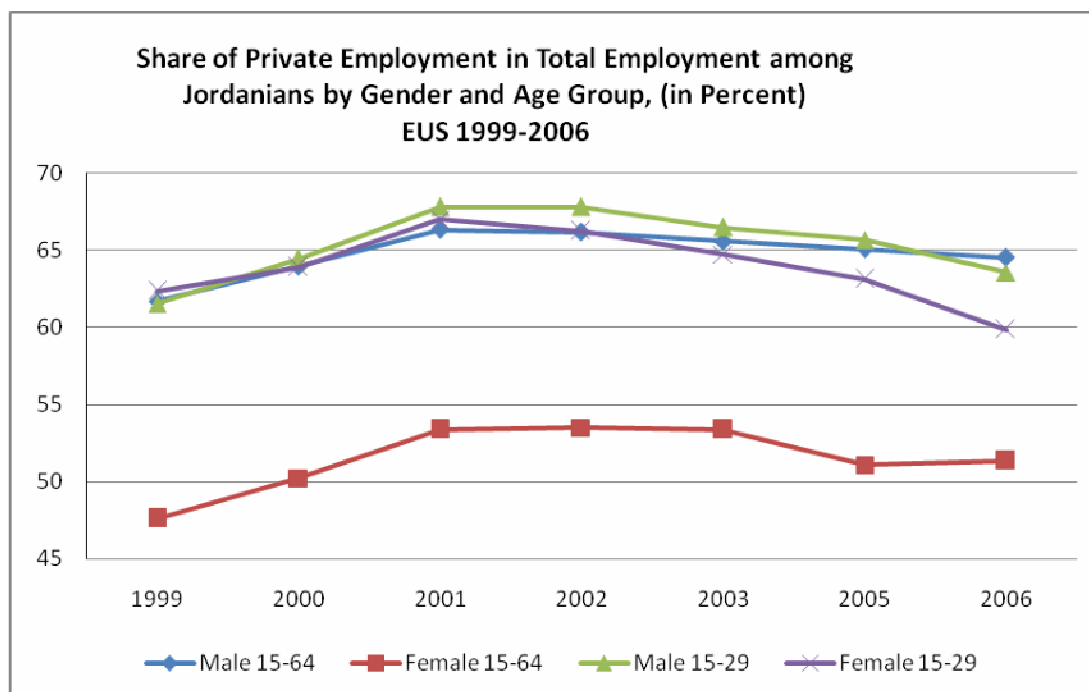

|                      | Average Annual Growth Rate (%) |           |
|----------------------|--------------------------------|-----------|

Source: Authors' calculations based on EUS data

We now turn to the examination of the sectoral breakdown of employment along gender lines among Jordanians. Jordanian women are much more dependent on public sector employment than men, with nearly fifty percent of women 15-64 working in the public sector. However, young

employed women are just as likely to be found in the private sector as young men and men overall (see Figure 2.4). By 2001, over two thirds of employed young women were to be found in the private sector, up from 54 percent for women overall. This sharp increase in private employment for young women is reflected in the very rapid rate of female employment in the 1999-2001 period. However, as the public sector resumed hiring in the subsequent period, the proportion of young women in the private sector declined more rapidly than for men. These trends confirm that the public sector is the preferred destination for young women and that they turn to the private sector only when necessary.

Figure 2.4

#### Comparison between EUS and ES

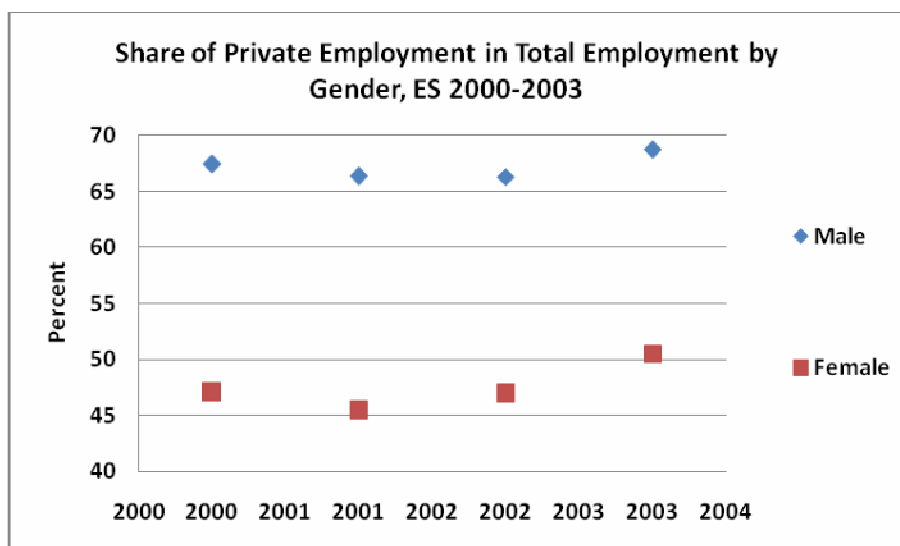

Table 2.3 presents the evolution of the employment size and distribution by gender and sector of ownership for Jordanians according to the establishment-based Employment Survey (ES) data from 1994 to 2003. The ES is nationally representative. It covers all public enterprises and all private enterprises with 50 and more employees, and a stratified sample of private enterprises below that size. The agricultural sector is excluded and most of the construction sector is not covered in the ES. The sampling frame of the ES changed significantly after 1999 to include a much better representation of small private sector establishments. Thus before 2000 the coverage of the private sector is very partial and not comparable to the EUS. Thus, the comparison between ES and EUS data is restricted to the period 2000-2003.

Table 2.4 presents the evolution of the employment size and distribution by gender and sector of ownership given by the EUS excluding the agricultural sector in order to be comparable with the ES

figures presented in Table 2.3. Some disparities appear when ES and EUS figures are compared. The ES understates the number of employed Jordanian males in both public and private sectors. Indeed, in 2003, the size of male employment obtained by the EUS is 1.8 times higher in the public sector and 1.4 times higher in the private sector than that reported by the ES. Conversely, the ES seems to better capture female employment in both public and private sectors and disparities across the two data sources are smaller. For instance, the size of female employment given by the ES in 2003 is larger by 27.6 percent in the public sector and by 17.0 percent in the private sector. This is probably because most employed Jordanian women are working in formal enterprises that are well covered by the ES.<sup>8</sup>

Over the period 2000-2003, both EUS and ES data show the same trend of a growing private sector share (see Figures 2.4 and 2.5). However, while the share of male private employment given by the ES is larger than the one obtained by the EUS, it is the contrary for female employment.

## 2.3 The Structure of Labor Demand by Establishment Size

Because data on firm size is only available from the establishment based Employment Survey (ES), the analysis in this section relies on that source only. It also focuses exclusively on the employment of Jordanians, since the representation of non-Jordanians in the ES is very weak.

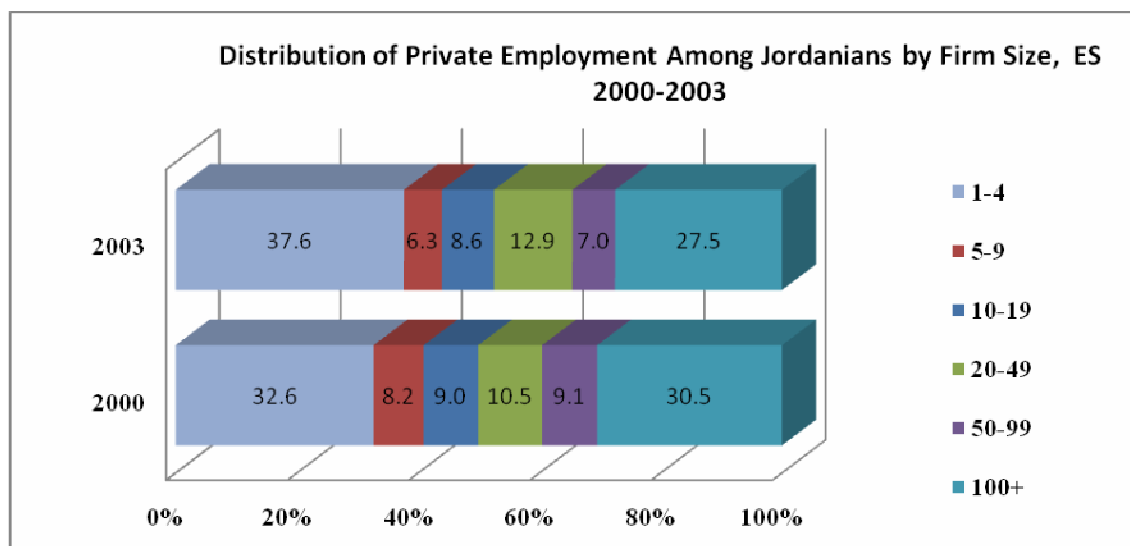

Table 2.5 presents the evolution of the size (in terms employees' number) of private enterprises in Jordan according to the ES from 1994 to 2003. Due to the fact that the ES sampling frame has changed in 1999, the analysis is limited to the period 2000-2003. This table shows that in 2003 almost two-thirds of Jordanian private sector employment was in either very small or very big enterprises. Indeed, more than one third (37.6 percent) of the employment of Jordanians in private establishments is in very small enterprises with less than 5 employees. At the same time employment in very large enterprises employing 100 and more employees represents more than one fourth (27.5 percent) of total employment in the private sector. The share of small to medium enterprises (5-9; 10-19; 20-49 and 50-99 employees) ranges between 6.3 and 12.9 percent.

Source: ES 1994-1998 & 2000-2003

Figure 2.6

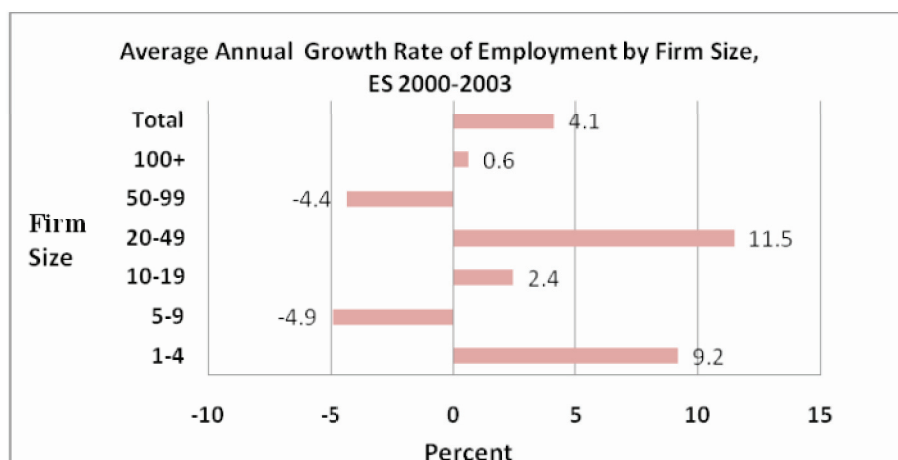

Source: Authors' calculations based on data from ES 2000 and 2003.

Figures 2.6 and 2.7 illustrate the evolution of the distribution of private employment among Jordanians by firm size between 2000 and 2003.<sup>9</sup> They show that the share of very small enterprises (with less than 5 employees) increased from 32.6 to 37.6 percent due to a high growth rate of 9.2 percent per annum (see figure 2.7). Conversely, the share of enterprises with 5 to 9 employees and 10 to 19 employees decreased over the period 2000-2003 either because their employment declined or grew very slowly. The number of medium size enterprises (employing between 20 and 49 workers) grew very fast (+11.5 percent per annum on average) and their share increased from 10.5 to 12.9 percent. The share of large enterprises (50 employees and above) declined from 39.6 percent to 34.5 percent as their number either declined or remained almost stable.

---

<sup>9</sup> However, it has to be noted that, as shown in Table 2.5, the evolution of the distribution of private employment by firm size is not smooth between 2000 and 2003 and fluctuated a lot.

Figure 2.7

Source: authors' calculations based on data from ES 2000 and 2003.

## 2.4 The Structure of Labor Demand by Economic Activity<sup>10</sup>

The acceleration of GDP growth in the 2002-2006 period was by no means uniform across all industries. Growth in some industries decelerated and it accelerated in others. For instance, as shown in Figure 2.8, the growth of the manufacturing and construction sectors decelerated slightly from the first to the second sub-period, so did that of the community, social, and personal services industry. The finance and insurance industry, which grew very rapidly in the 1999-2002 period slowed significantly, but is still growing faster than the economy as a whole at more than 7 percent per annum. In contrast, the growth rate of the trade, transport and real estate sectors accelerated significantly. The transport sector is now the fastest growing sector of the economy, growing at nearly 17 percent per annum. The tourism sector, as captured by the restaurants and hotels industry, was hit very hard by the after effects of the September 11<sup>th</sup> 2001 attacks and actually contracted by nearly 12 percent per annum in the 1999-2002 period. However, it made a dramatic recovery in the subsequent sub-period, growing at an average rate of nearly 9 percent per annum.

In what follows, we trace the effects of these economic trends on the structure of labor demand in Jordan. We should keep in mind that in some instances, the trends observed in the value added data will not be fully reflected in the employment data. For instance, the agricultural and constructions sectors mainly employ temporary foreign workers, who may not be very well represented in the EUS or ES data.

---

<sup>10</sup> Annex Tables 7, 8, present the male and female employment by sector and economic activity according to the EUS 1995-2006.

Figure 2.8

#### 2.4.1 Employment by Economic Activity and Nationality

The evolution of the structure of overall employment by industry, as captured by the EUS, is shown Figure 2.9 and the rates of growth by industry and nationality are shown in Table 2.6. Agriculture, which, in terms of value added, was growing faster than average in both sub-periods has lost in terms of employment share, between 1999 and 2002 and then its share remained stable until 2006. This is in part due to the fact that the agricultural sector in Jordan is increasingly relying on non-Jordanian workers and many of these foreign workers are not captured in the EUS. In fact, as shown in Table 2.6, employment in agriculture has fallen in absolute terms in the 1999-2002 period and more so among Jordanians. All the recovery of employment in this sector was made up by growth among non-Jordanians.

The share of employment in manufacturing has increased in the 1999-2002 sub-period, reflecting the rapid growth in value added of this sector. The slowing of the growth in manufacturing value added in the 2002-2006 period was accompanied by a decline in its employment share (Figure 2.9). Again, there was large-scale substitution of non-Jordanian workers for Jordanians in the second sub-period, when Jordanian employment in manufacturing declined by -0.2% per annum whereas that of non-Jordanians grew by 14 percent per annum.

Despite a slight deceleration in the rate of growth of value added in the construction from the first to the second sub-period, the share of employment in construction declined from 1999 to 2002 and then increased from 2002-2006, when it grew at 8 percent per annum. Again, the rate of growth of employment in this sector was much more rapid among foreigners than among Jordanians (See Table 2.6). The opposite trend was true in wholesale and retail trade, which first saw an increase in its share in total employment and then a decline. Employment in restaurant and hotels is still very limited, but was rising at about 6.5 percent per annum in both sub-periods.

Despite a rapid acceleration in the growth of value added in the transport, storage and communications sector from 1999-2002 to 2002-2006, the share of employment in that sector has fallen continuously since 1999. This reflects a rate of employment growth that is quite a bit less than average in that sector in both sub-periods (see Table 2.6). The deceleration of the growth in value added in the finance and insurance sector was not reflected in the employment data. We actually observe an acceleration of employment growth in that sector from 1999-02 to 2002-06. The same contradictory pattern appears in the real estate and business services sector, where value added growth accelerated but employment growth decelerated significantly

The share of employment in public administration declined significantly from 1999 to 2002 only to recover slightly in 2006, reflecting the recovery of government hiring in the latter sub-period. In contrast, the share of employment in education increased slightly from 1999 to 2002 and then fell sharply from 2002 to 2006. Finally, the employment share of people engaged in domestic services has been increasing steadily since 1999.

Source: EUS 1995-2003 & EUS 2005-2006

An examination of the distribution of employment by economic activity and nationality reveals major differences between the employment patterns of Jordanians and non-Jordanians. As shown in Figure 2.10, non-Jordanians are much more likely to be employed in agriculture, construction and domestic services. They are equally likely as Jordanians to be found in manufacturing and much less likely to be found in wholesale and retail trade, transport, storage and communications, finance and insurance, public administration and education and health. Even so, these figures probably understate the predominance of non-Jordanians in agriculture and construction, two sectors that are not well captured by the EUS.

Figure 2.10

Source: Authors' calculations based on data from the EUS.

#### 2.4.2 Gender Differences in Employment by Economic Activity among Jordanians

The distribution of employment by economic activity among Jordanians shows significant differences by gender. As shown in Figure 2.11, the distribution of employment by economic activity in 2006 among Jordanian males indicates large concentrations in four industry groups, namely manufacturing, wholesale and retail trade, transport, storage and communications and public administration. Jordanian female workers on the other hand are concentrated in the care economy, namely education, health and social services, and in public administration, wholesale and retail trade, and manufacturing. Nearly forty percent of female employment is in education alone. There is hardly any female employment in transport, storage and communications. The “other” category is quite sizable among female workers as well and is dominated by finance and insurance and other personal, community and social services.

Figure 2.11

\*Other includes utilities, finance & insurance, other community, personal and social services, households hiring domestic workers, and workers in international organizations

Source: Authors' calculations based on data from EUS.

Annex Tables 7 and 8 present the distribution of male and female employment by economic activity and sector of ownership from 1995 to 2006. They show clear differences between public and private sectors. Indeed, in the public sector in 2006, men were concentrated into three main activities but the vast majority (59.4 percent) were working in public administration; 15.5 percent are employed in the educational sector and 10.2 percent in other community, social and personal services (where 81.6 percent of them work in the sewage and refuse disposal sector). More than 90 percent of Women in the public sector in 2006 were employed in only three activities, with the majority working in education (58.4 percent). The other two sectors are health and social services (18.6 percent) and public administration (13.9 percent).

In the private sector, almost three-quarters of employed men in 2006 are working in only four activities: wholesale and retail trade (28.6 percent), manufacturing (18.2 percent), transport, storage and communication (15.0 percent) and construction (10.6 percent). When decomposing the private manufacturing sector we find that men are employed mainly in the following sub sectors: food products and beverage (17.5 percent); furniture and other (16.5 percent); fabricated metal products (14.8 percent) and textile and garment (11.1 percent). It has to be noted that male employment in the textile and garment sector grew very fast and, consequently, its share went up from 7.4 percent in 1999 to 11.1 percent in 2006. Education is still the primary employer of women in the private sector, with a share of 22 percent in 2006, followed by the manufacturing sector (19.9 percent),

health and social services (12.4 percent) and wholesale and retail trade (12.4 percent). These four activities account for two-thirds of total female employment in the private sector in 2006. The desegregation of the manufacturing sector reveals that women are concentrated mostly in the textile and garment sector (59.8 percent) and in the chemical industry (19.0 percent).

### ***2.4.3 Comparison EUS and ES***

As the sampling frame of the ES changed in 1999, ES 2000 to ES 2003 are consistent and better capture private employment. Thus, the comparison of employment distribution between EUS and ES data is restricted to the period 2000-2003<sup>11</sup>. As mentioned in Section 2.2 above, the ES underestimate male employment whereas they better capture female employment as compared with the EUS.

Annex Tables 9 and 10 give the male employment size and distribution by economic activity according to the ES from 2000 to 2003. These tables show that the ES underestimate substantially (as compared to EUS) the number of men working in the following economic activities: construction (by 77 percent), transport, storage and communication (by 75 percent), mining and quarrying (by- 41 percent), and public administration (by -55 percent)<sup>12</sup>. Except for public administration, this underestimation is probably due to the fact that these activities tend to employ workers informally, who are difficult to capture by the ES. Consequently, the distribution of male employment by economic activity differs across data sources.

Annex Tables 11 and 12 give the female employment size and distribution by economic activity according to the ES from 2000 to 2003. They reveal that the ES better captures female employment in the following activities: public administration (by +63 percent), education (by +36 percent), health and social services (by +19 percent) and wholesale and retail trade (by +27 percent). Thus it appears that the EUS understates female employment in Jordan, possibly because of the reluctance of households to admit that their female members are working.

## **2.5 The Structure of Labor Demand by Occupation**

### ***2.5.1 The Evolution of Employment by Occupation and Nationality***

The evolution of employment by occupation in Jordan exhibits some important changes in the two sub-periods under examination here. As shown in Figure 2.12, the most significant changes in the period from 1999 to 2002 are the increase in the share of professionals, service and sales workers and elementary occupations, and the sharp decline in the share of skilled agricultural and fishing workers. From 2002 to 2006, the most notable changes are the continued growth of the occupations at the two ends of the occupational distribution, namely professionals and elementary occupations.

---

<sup>11</sup> In order to compare ES and EUS, the agricultural sector is excluded from the distribution of employment by economic activities in the EUS.

<sup>12</sup> However, EUS seems to overestimate the number of males working in public administration since 1997 as their number increased dramatically from 69499 in 1996 to 151978 in 1998.

This sub-period also saw a decline in the share of technicians and associated professionals, clerks, and craft and related trade workers.

According to the population census of 2004, professionals in Jordan are mainly marketing and public relation specialists, teachers in basic and secondary education, engineers, business professionals, and health professionals. The high growth rate of professionals might be reflecting the high demand in education in Jordan over the last decade.

Figure 2.12

Source: Authors' calculations based on data from EUS.

A comparison of the occupational distribution of employment among Jordanians and non-Jordanians reveals significant differences. As shown in Figure 2.13, non-Jordanians in 2006 had very little representation among professionals, technicians and clerks. They are modestly represented among services and sales workers and plant and machinery operators, but are over-represented in elementary occupations, craft and related trade workers. Workers in elementary occupations, i.e. unskilled workers, make up nearly 45 percent of foreigners in Jordan in 2006, up from 25 percent in 1999. Thus the very rapid growth in demand for elementary occupations was essentially met by importing more foreign workers.

Figure 2.13

Source: Authors' calculations based on data from EUS.

Although the growth rate among non-Jordanian professionals is higher than among Jordanian professional, they start from such a low base that foreigners still make up a small fraction of professionals in Jordan. However, in the case of workers in elementary occupations, the more rapid growth rate of non-Jordanians is driving the more rapid growth rate overall. By our estimates, foreigners make up 42 percent of these workers in Jordan. The other significant occupational categories in which there appears to be large-scale substitution of foreign for Jordanian workers are skilled agricultural and fishing workers and services and sales workers. The number of Jordanians in these occupations has continued to decline or increase very slowly, whereas that of non-Jordanians has increased rapidly from 2002 to 2006 (see Table 2.7).

Table 2.7: Average Annual Growth Rate of Employment by Occupation and Nationality

|  | Jordanians  |             | Non-Jordanians |              | Total       |             |

### 2.5.2 Gender Differences in Employment by Occupation among Jordanians

As in the case of the distribution of employment by economic activity, there are stark differences along gender lines in the distribution of employment by occupation among Jordanians. As shown in Figure 2.14, women in Jordan are highly over-represented among occupations at the top of the occupational hierarchy and under-represented in blue collar occupations at the bottom of the hierarchy. Female professionals (mostly educators) make up about 45 percent of female employment among Jordanians, and technicians and associated professionals make up another 27 percent, as compared to 15 percent and 8 percent, respectively for Jordanian males. Besides the clerk category, women are under-represented in all other occupational categories.

Figure 2.14

The large share of professionals among employed Jordanian women is the result of a rapid increase in the share of professionals in female employment in recent years in Jordan. Indeed, the proportion of professionals increased from 28.5 percent in 1999 to 44.7 percent in 2006. This increase reflects the very high average annual growth rate of female professionals of +6.5 percent between 1999 and 2002 and +11.4 percent between 2002 and 2006. This is probably a consequence of the pressure on primary and secondary education as more than half of professional women are either teachers in basic education (30.9 percent) or secondary education (25.6 percent) according to the 2004 population census. The proportion of female service and sales workers (mostly vendors or personal service workers) and elementary occupations (mostly domestic and related helpers) also increased between 1999 and 2006. See Annex Tables 14 and 15 for a distribution of Jordanian female workers by occupation and sector from 1995 to 2006, as rendered by the EUS.

In contrast to what happened to professionals, the proportion of clerks among working women decreased substantially from 1999 to 2006, going down from 12.3 percent in 1999 to 8.0 percent in 2006, reflecting a rapid decline in the number of female clerks in the 2002-2006 period (-9.6 percent per annum on average). The 2004 Population Census shows that female clerks are either library and mail and related clerks (43.6 percent) or secretaries and keyboard-operators (41.8 percent). The proportion of female technicians and associate professionals also went down from 34.6 percent in

1999 to 26.7 percent in 2006. According to the 2004 population census, women working as technicians are primary education teaching associate professionals (34.8 percent), administrative associate professionals (28.9 percent), and nursing and midwifery associate professionals (16.7 percent). Finally, the share of craft and related trade workers in total female employment also declined from 6.2 percent to 5.7 percent over the period of analysis due to a negative growth rate over the period 2002-2006. Almost all these women (95.4 percent) are textile and garment workers according to the Population Census.

## 2.6 Conclusions

The period from 2002 to 2006 in Jordan saw an acceleration of economic growth that led to an acceleration of labor demand. Nevertheless, Jordanian workers benefitted only partially from this acceleration, due to the large influx of foreign workers that occurred during this period to meet the increased demand. Although the growth of overall employment in Jordan increased from 2.1 percent p.a. in 1999-2002 to 5.2 percent p.a. in 2002-2006, employment growth among Jordanians was much lower at 1.6 percent p.a. and 2.8 percent p.a., respectively. Of the 22 thousand jobs created by the economy, on average, in the 1999-2002 period, 37 percent went to non-Jordanians. With the acceleration of job growth to 55 thousand jobs p.a. in the 2002-2006 period, more than half the job growth (53%) went to foreign workers. The growing role of foreign labor in the Jordanian economy probably explains the declining share of private sector employment among Jordanians. That share had risen from 1999 to 2001, but the trend was reversed thereafter. The Jordanian private sector continued to grow, but was increasingly relying on foreign workers to meet its labor needs.

Based on the limited data we have on employment by establishment size, we found that the most dynamic parts of the Jordanian labor market in terms of job growth were the very small firms of 1 to 4 workers and the medium establishments in the 20 to 49 worker category. All other size classes grew more slowly than overall employment.

Economic growth in Jordan in the 1999-2002 period was concentrated in manufacturing, construction, trade, and finance and insurance. Accordingly, employment in these industries grew faster than average during this period. In the 2002-2006 period, manufacturing and construction slowed a little, but were still growing faster than average, trade speeded up and the tourism industry, as represented by restaurants and hotels, made a significant recovery after a period of sharp decline. Significant accelerations of growth during this period were also observed in transport, storage and communications and in real estate and business services. The pattern of growth in the 2002-2006 period resulted in rapid employment growth in agriculture, mining, utilities, construction, restaurants and hotels, finance and insurance, public administration and domestic service. However, Jordanians managed to capitalize on the growth of only a subset of these industries, and there was large-scale substitution of foreign workers for Jordanians in other industries. The employment of Jordanians grew in public utilities, restaurants and hotels, finance and insurance and public administration, whereas the increased demand for labor was met by foreign workers in agriculture,

mining, construction, and domestic service. On the occupational front a similar contrast existed between domestic and foreign workers. Domestic workers benefited from the growth in demand for professionals whereas the increased demand for unskilled workers in elementary occupations was essentially met by increased reliance on foreign labor.

## **Chapter 3: Comparison of Major Labor Market Indicators Between the 2004 Population Census and the 2003 and 2005 Employment and Unemployment Survey**

This chapter aims at comparing major labor market indicators measured by two different household data sources in Jordan, namely the Employment and Unemployment Surveys (EUS) and the Population Census. The major concern is to explain why labor force participation and unemployment rates are much higher when measured by the most recent Population Census 2004<sup>13</sup> than by the EUS 2003 and EUS 2005<sup>14</sup>. In order to investigate this issue, we will look closely at labor force participation (LFP) rates by gender and urban/rural location are decomposed into unemployment rates, employment and unemployment ratios.

### **3.1 Data preparation:**

A common file for EUS 2003, EUS 2005 and Census 2004 has been created to facilitate the comparison of major labor market indicators such as labor force participation, unemployment rate and employment ratios. This file uses a unique individual identification based on the survey or census year, the household geographical residency (governorate, district, sub-district, locality, area and neighborhood), the household code and the individual code within its household. Annex 31 contains the list of the common variables for each survey and Census. Questions regarding major labor market indicators such as current work status, employment status and unemployment are common to the three data sources and are based on international definitions. Also, both Census and EUS use the same reference period of one week preceding the interview. However, contrarily to the Census, the EUS contain more details on the unemployed regarding searching methods and reasons for not searching for a job.

### **3.2 Labor Force Participation Rates**

This report uses two definitions of labor force participation. According to the standard definition an unemployed person is someone who is not working, available to work and searching for a job. In the broad definition the search criterion is relaxed. So, labor force and unemployment rates are higher according to the broad definition as they include the discouraged unemployed.

Tables 3.1a and 3.1b present labor force participation rates by gender and urban/rural location according to EUS 2003, EUS 2005 and Census 2004.

---

<sup>13</sup> This report uses a 10 percent sample of the Population Census 2004.

<sup>14</sup> EUS 2004 has not been taken into consideration for this analysis as it is not comparable to other years of EUS.

Table 3.1a: LFP Rate by Gender and Urban/Rural Location (Standard Definition), Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 67.4  | 12.3   | 39.9  | 62.7  | 10.1   | 36.8  | 66.4  | 11.8   | 39.3  |
| Census 2004 | 71.1  | 19.4   | 45.6  | 69.1  | 22.0   | 45.8  | 70.7  | 19.9   | 45.6  |
| EUS 2005    | 68.2  | 12.7   | 40.7  | 64.0  | 10.6   | 37.3  | 67.5  | 12.3   | 40.1  |

Table 3.1b: LFP Rate by Gender and Urban/Rural Location (Broad Definition), Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 69.3  | 13.7   | 41.6  | 66.1  | 12.1   | 39.5  | 68.6  | 13.4   | 41.1  |
| Census 2004 | 72.2  | 22.2   | 47.5  | 70.3  | 25.2   | 48.0  | 71.8  | 22.9   | 47.6  |
| EUS 2005    | 70.1  | 14.5   | 42.5  | 66.8  | 12.6   | 39.7  | 69.5  | 14.1   | 42.0  |

On the one hand, overall labor force participation rates (standard definition) measured by both surveys (EUS 2003 and EUS 2005) are consistent. They show a very slight increase from 39.3 percent in 2003 to 40.1 percent in 2005. This growth is observed for both males and females and in both urban and rural areas. For instance, over the period 2003-2005, male LFP goes up from 66.4 to 67.5 percent while female LFP increases from 11.8 percent to 12.3 percent.

On the other hand, overall LFP measured by Census 2004 (45.6 percent) is much higher than the ones obtained using the EUS. This disparity is observed among both sexes and in both urban and rural locations. But, whereas LFP rates' gaps across data sources are small among males they are very large among females and in rural areas. For instance, male LFP rate in 2004 (Census year) reaches 70.7 percent compared to 66.4 percent in 2003 and 67.5 percent in 2005 (which represents a gap that ranges between 4.7 percent and 6.5 percent). Whereas female LFP measured by the Census reaches 19.9 percent compared to 11.8 percent in 2003 and 12.3 percent in 2005 (which represents a difference that ranges between 61.8 percent and 68.6 percent). Disparities across data sources are at maximum among rural women. Indeed, rural female LFP measured by Census 2004 (22.0 percent) is more than twice that obtained by EUS 2003 (10.1 percent) and by EUS 2005 (10.6 percent).

When the broad definition of LFP is used, disparities between census and EUS data are very similar. Thus, the type of definition used does not affect the results according to the different data sources.

### 3.3 Unemployment Rate

Tables 3.2a and 3.2b show that unemployment rates are also much higher when measured by the Census than by both EUS 2003 and 2005. Indeed, overall unemployment rate (standard definition) reaches 25.6 percent in 2004 compared to 14.4 percent with EUS 2003 and 14.6 percent with EUS 2005 which represents a difference of 77.8 percent between 2004 and 2005. This unemployment rate gap between data sources is observed for both men and women and in both urban and rural areas. But, as for LFP rates, disparities are larger among females than among males and in rural areas compared to urban areas. For example, male unemployment rate is equal to 19.6 percent in 2004 as compared to 13.3 percent in 2003 and 12.7 percent in 2005 which represents a gap across data sources that ranges between 47.4 percent and 54.3 percent. Whereas female unemployment rate measured by the population census reaches a very high level (47.4 percent) as compared to 20.5 percent measured by EUS 2003 and 25.5 percent by EUS 2005, representing a gap that varies between 85.9 percent and 131.2 percent. Disparities are similar across data sources between urban and rural females while they are larger among urban males compared to their rural counterparts. Very similar results are obtained when using the broad definition of unemployment (see table 3.2b).

Table 3.2a: Unemployment Rate by Gender and Urban/Rural Location (Standard Definition), Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 12.4  | 19.2   | 13.5  | 16.8  | 26.5   | 18.2  | 13.3  | 20.5   | 14.4  |
| Census 2004 | 17.6  | 43.2   | 23.0  | 27.0  | 60.5   | 35.0  | 19.6  | 47.4   | 25.6  |
| EUS 2005    | 11.7  | 24.3   | 13.7  | 17.3  | 32.5   | 19.5  | 12.7  | 25.5   | 14.6  |

Table 3.2b: Unemployment Rate by Gender and Urban/Rural Location (Broad Definition), Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 14.9  | 27.4   | 16.9  | 21.1  | 38.9   | 23.8  | 16.2  | 29.6   | 18.3  |
| Census 2004 | 18.8  | 50.6   | 26.2  | 28.2  | 65.5   | 37.9  | 20.8  | 54.2   | 28.7  |
| EUS 2005    | 14.1  | 33.6   | 17.4  | 20.8  | 43.2   | 24.3  | 15.2  | 35.1   | 18.6  |

### 3.4 Employment Ratios

Tables 3.3a, 3.3b, 3.3c and 3.3d present various employment ratios indicators by gender and urban/rural location measured by the Census and EUS. First, in contrast to LFP and unemployment rates, overall employment ratios do not vary a lot across data sources. However, the employment ratio measured by the Census is slightly lower among males (56.7 percent in 2004 compared to 59.0 percent in 2005) while it is slightly higher among females (10.2 percent in 2004 compared to 9.2 percent in 2005). Disparities are also larger in rural areas than in urban areas especially among females. For instance, employment ratio among rural females obtained by the Census is higher by 22.5 percent than the one obtained by EUS 2005, whereas the difference is only of 14.6 percent among urban females.

Table 3.3a: Employment Ratio by Gender and Urban/Rural Location, Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 59.0  | 10.0   | 34.6  | 52.1  | 7.4    | 30.1  | 57.5  | 9.4    | 33.6  |
| Census 2004 | 58.6  | 11.0   | 35.1  | 50.5  | 8.7    | 29.8  | 56.8  | 10.5   | 33.9  |
| EUS 2005    | 60.2  | 9.6    | 35.1  | 52.9  | 7.1    | 30.0  | 59.0  | 9.2    | 34.2  |

Second, when decomposing the employment ratio into wage and non wage employment ratios (tables 3b and 3c), it is clear that the slight difference observed in overall employment ratios across data sources is only due to differences in wage employment ratio measurements. Indeed, non wage employment ratios almost did not vary between 2003 and 2005 and are almost the same whatever the data source used for both males and females and both urban and rural regions. The extremely low non wage employment ratios among women (ranging between 0.3 percent and 0.5 percent) reflects the fact that non wage employment represents a very small share of total employment (approximately 5 percent whatever the data source used). The vast majority of male employment is also mainly composed by wage employment (approximately 82 percent whatever the data source used). Thus, wage employment ratios disparities across data sources are due to differences in terms of wage employment ratios measurements.

Table 3.3b: Wage Employment Ratio by Gender and Urban/Rural Location, Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 47.4  | 9.4    | 28.4  | 45.1  | 7.0    | 26.3  | 46.9  | 8.9    | 28.0  |
| Census 2004 | 47.1  | 10.5   | 29.0  | 44.5  | 8.3    | 26.6  | 46.6  | 10.0   | 28.5  |
| EUS 2005    | 48.6  | 9.1    | 29.0  | 46.2  | 6.8    | 26.5  | 48.2  | 8.7    | 28.5  |

Table 3.3c: Non Wage Employment Ratio by Gender and Urban/Rural Location, Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 11.6  | 0.6    | 6.1   | 7.0   | 0.4    | 3.7   | 10.6  | 0.5    | 5.6   |
| Census 2004 | 11.4  | 0.5    | 6.0   | 6.0   | 0.4    | 3.2   | 10.2  | 0.5    | 5.4   |
| EUS 2005    | 11.7  | 0.6    | 6.1   | 6.7   | 0.3    | 3.5   | 10.8  | 0.5    | 5.7   |

Table 3.3d gives employment ratio outside agriculture by gender and urban/rural location. It clearly shows that employment ratios outside agriculture is almost the same as employment ratios, in particular at the national and urban levels, reflecting the very small share of agricultural activities in total employment in Jordan. Moreover, the comparison between Census 2004, EUS 2003 and EUS 2005 reveals very similar disparities across data sources to the ones obtained by employment and wage employment.

Table 3.3d: Employment Ratio Outside Agriculture by Gender and Urban/Rural Location, Ages 15-64 (in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 58.6  | 9.9    | 34.2  | 50.2  | 6.9    | 28.5  | 56.8  | 9.3    | 33.0  |
| Census 2004 | 58.2  | 10.9   | 34.7  | 48.8  | 8.3    | 28.4  | 56.2  | 10.3   | 33.4  |
| EUS 2005    | 59.8  | 9.5    | 34.7  | 51.0  | 6.9    | 28.5  | 58.3  | 9.1    | 33.6  |

### 3.5 Unemployment Ratios

The unemployment ratio measures the ratio of unemployment to the workforce (population aged between 15 and 64). Thus, the LFP rate is only the addition of employment and unemployment ratios.

Tables 3.4a and 3.4b present unemployment ratios by gender, urban and rural location according to Census and EUS data using the standard and broad definitions of unemployment. These tables clearly show the largest disparities across data sources. Indeed, overall unemployment ratio (standard definition) reaches 11.7 percent in 2004 which is approximately two times the one obtained in 2003 (5.7 percent) and the one obtained in 2005 (5.9 percent). These disparities are larger among women than among men and in rural areas compared to urban ones. For instance, female unemployment ratio obtained by the Census (9.4 percent) is almost four times the one obtained by EUS 2003 (2.4 percent) whereas male unemployment ratio in 2004 (13.9 percent) is higher by 56.2 percent than the one obtained by EUS 2003. Moreover, rural female unemployment ratio in 2003 (13.3 percent) is almost five times the one measured by EUS 2003.

Table 3.4a: Unemployment Ratio by Gender and Urban/Rural Location (Standard Definition), Ages 15-64 ( in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 8.4   | 2.4    | 5.4   | 10.6  | 2.7    | 6.7   | 8.9   | 2.4    | 5.7   |
| Census 2004 | 12.5  | 8.4    | 10.5  | 18.7  | 13.3   | 16.0  | 13.9  | 9.4    | 11.7  |
| EUS 2005    | 8.0   | 3.1    | 5.6   | 11.1  | 3.4    | 7.3   | 8.5   | 3.1    | 5.9   |

Table 3. 4b: Unemployment Ratio by Gender and Urban/Rural Location (Broad Definition), Ages 15-64 ( in percent)

|             | Urban |        |       | Rural |        |       | Total |        |       |
|-------------|-------|--------|-------|-------|--------|-------|-------|--------|-------|
|             | Male  | Female | Total | Male  | Female | Total | Male  | Female | Total |
| EUS 2003    | 10.3  | 3.8    | 7.0   | 13.9  | 4.7    | 9.4   | 11.1  | 4.0    | 7.5   |
| Census 2004 | 13.6  | 11.2   | 12.4  | 19.9  | 16.5   | 18.2  | 14.9  | 12.4   | 13.7  |
| EUS 2005    | 9.9   | 4.9    | 7.4   | 13.9  | 5.4    | 9.7   | 10.6  | 5.0    | 7.8   |

When using the broad definition of unemployment, disparities across data sources are quite similar even though smaller. Releasing or not the search criterion in defining unemployment does not affect seriously the comparison between data sources.

### **3.5 Conclusions**

Even though the census and the EUS do use the same definitions and questions to measure employment and unemployment and consequently the labor force, the results obtained by Census 2004 are very different and higher than the ones obtained by EUS 2003 and EUS 2005. The decomposition of LFP rates into employment and unemployment ratios shows that disparities across data sources reflect disparities in both employment and unemployment measures. However, higher LFP rates by Census 2004 are mainly due to overestimation of unemployment among females and in particular among rural females. With a very large, typically less trained workforce administering the interviews, the census is less able to apply the international definition of unemployment which requires several precise criteria for someone to be considered unemployed. Therefore the EUS figures must be considered more reliable in this case.

## **Chapter 4: Estimation of a Wage Index for Jordan: 1994-1998 & 2000-2003**

### **4.1 Introduction**

This chapter analyzes the wage index trend in Jordan using the most recent establishment-level data available from the annual Employment Survey (ES). It aims at determining the trend in nominal and real wages by institutional sector, sector of economic activities, and occupation over the periods 1994-1998 & 2000-2003.

The results of the analysis reveal that real hourly wages have been fairly stable for Jordanians in the private sector in Jordan over the two sub-periods studied, but have fallen in the public sector. The decline in the public sector was more pronounced in 1994-1998 period than in 2000-2003 period, where they only dropped by 2 percent over the four-year period. Females have fared worse in terms of wage growth than males, especially in the private sector, with real female wages in that sector falling by 6.5 percent in 1994-98 and by 2.7 percent in 2000-2003.

There was also significant variation in wage trends by economic activity. Real wages increased significantly mining and quarrying, construction, restaurants and hotels, transport, storage and communications, and real estate and business services. They declined in finance and insurance, public administration, education and health and social services, and remained fairly stable in manufacturing, utilities, wholesale and retail trade.

Real wage trends by occupation also showed some important variations. During the 1994-98 period, the largest increases were recorded for legislators and senior officials and the greatest declines were recorded from technicians, skilled agricultural and fishing workers (which are not well represented in the ES), and service and sales workers. In the 2000-2003 period, the largest increases were for clerks, craft and related trade workers, and elementary occupations. Services and sales workers experienced a large increase from 2002 to 2003, making up for their losses in the 1990s, although this result should be treated with caution due to the frequent fluctuations in their wages. The occupation group that fared the worst from 2000-2003, was legislators and senior officials, who had fared the best in the previous period.

Section 4.2 presents the data preparation process for the creation of a common data file that pools all the available annual Employment Surveys into one data set. Section 2 explains the methodology used to estimate an hourly wage index that corrects for the changing composition of the workforce over time. Finally, the results are presented in the Section 3.

## 4.2 Data Preparation

The analysis presented in this paper is based on the micro data of the annual establishment-level Employment Survey (ES) carried out by the Jordanian Department of Statistics (DOS) over the period 1994-2003.

### *Compatibility of the Annual ES:*

For compatibility purposes, the analysis is restricted to the following sub-periods: 1994-1998 and 2000-2003, which are considered separately. Indeed, in 1999, an Establishment Census was carried out by DOS and, as a result, the ES sampling frame has changed considerably. The 1999 ES is excluded from the analysis as it is not comparable in terms of accuracy or coverage with the ES from other years. The following ES surveys (2000-2003) used the same sample design based on the 1999 Establishment Census and are thus comparable. Since the conceptual framework of the ES changed once more in 2004, the wage index study is restricted to the 1994-1998 and 2000-2003 periods.

### *The scope of the ES:*

The ES are nationally representative.

**Sector of Ownership:** all public enterprises are covered. Within the private sector, all enterprises with 50 and more employees are covered. Enterprises with fewer than 50 employees were sampled according to various sampling rates according to size from the frame provided by the 1999 establishment census. Appropriate weights are used to account for the sampling rate.

**Nationality:** Jordanians and foreigners are covered but non Jordanians workers seem to be underrepresented due to data collection difficulties.

**Industry:** the agricultural sector is excluded from the survey and most of the construction sector is not covered, as employment in these two sectors is mostly outside of fixed establishments.

### *Creation of a common data file:*

The objective is to create a common data file for all Employment Surveys, 1994-2003. First, the variables' definitions and codes are checked and are given a unique name for all years. Second, all establishment years are appended in one data file. The common data file contains the following variables at the governorate, district, sub-district and locality levels: total employment by type of occupation and by sex; nationality; establishment legal status; sector of ownership; occupation; economic activity; wage; total number of working hours and regular and irregular bonuses

### 4.3 Wage Index Methodology

Computing the hourly wage index by sector involves four steps as described below.

First step: determining the hourly wage for each cell

$$HourlyWage_{ijkle}^t = \frac{Wage_{ijkle}^t}{h_{ijkle}^t} \quad \text{where: } h_{ijkle}^t = \text{total working hours}$$

|   |   |                   |   |                 |
|---|---|-------------------|---|-----------------|
| i | = | sex               |   |                 |
| j | = | nationality       | e | = establishment |
| k | = | occupation        | t | = year          |
| l | = | economic activity |   |                 |

Second step: computing the average hourly wage

$$AW_{ijklm}^t = \text{mean}(\text{hourlyWage}_{ijkle}^t)$$

using as weights:  $m_{ijkle}^t = h_{ijkle}^t * \text{weight}_{ijkle}^t$

where m refers to an establishment size category. The averaging is therefore taking place over all cells in establishments in a given size category. This leads to a series of aggregated cells for each year indexed by sex, nationality, occupation, economic activity and establishment size.

Third step: computing the weighted average wage (WAW)

The weight is set by fixing the numbers of working hours in each aggregated cell to what it was in the reference year. This allows us to control for the composition of the workforce over time and thus compare wages across time while abstracting from fluctuations in composition of the workforce.

For the period 1994-1998, the reference year is 1998 and for the period 2000 – 2003, the reference year is 2003.

$$WAW_{ijklm}^t = q_{ijklm}^0 AW_{ijklm}^t$$

$$q_{ijklm}^0 = \frac{h_{ijklm}^0}{\sum_{ijklm} h_{ijklm}^0}$$

Fourth step: Wage Index for each sector

By aggregating over the other categories, it is possible to obtain wage indices by each of the relevant variables separately or in combination with each other. For example we can obtain the following indices:

- Wage Index by gender:

$$WI_i^t = \frac{\sum_{jklm} WAW_{ijklm}^t}{\sum_{jklm} WAW_{ijklm}^0}$$

- Wage Index by Economic Activity:

$$WI_t^t = \frac{\sum_{ijklm} WAW_{ijklm}^t}{\sum_{ijklm} WAW_{ijklm}^0}$$

- Wage Index by Nationality:

$$WI_j^t = \frac{\sum_{iklm} WAW_{ijklm}^t}{\sum_{iklm} WAW_{ijklm}^0}$$

- Wage Index by Occupation:

$$WI_k^t = \frac{\sum_{ijlm} WAW_{ijklm}^t}{\sum_{ijlm} WAW_{ijklm}^0}$$

Wage Index Results 1994-1998 & 2000-2003

#### 4.4 Sector and Nationality

Table 4.1 presents the trend in the nominal hourly wage index by sector of ownership and nationality over the periods 1994-1998 and 2000-2003<sup>15</sup>. As the number of foreign workers in the public sector is very small, the analysis of wage index among foreigners is limited to the private sector. Table 4.1 shows that the nominal hourly wages is the highest in the public sector reaching JD 1.29 in 2003 which is around 1.5 time that of the private sector among Jordanians (JD 0.85) and more than twice that of foreign workers (JD 0.61).

---

<sup>15</sup> Results on foreign workers should be used with caution as foreign workers are underrepresented in the ES.

| Nominal Hourly Wage Index (1994=100 for 1994-1998 & 2000=100 for 2000-2003) |            |       |       |       |       |       |       |       |       |       |
| Public sector   | Jordanians | 100.0 | 94.0  | 96.7  | 100.1 | 103.4 | 100.0 | 109.1 | 109.2 | 111.3 |
| Private sector  | Jordanians | 100.0 | 102.7 | 108.5 | 114.7 | 115.7 | 100.0 | 105.5 | 107.0 | 108.0 |
|   | Foreigners | 100.0 | 108.2 | 109.4 | 113.5 | 121.9 | 100.0 | 113.2 | 121.2 | 122.2 |

As shown in Table 4.1 and in Figure 4.1, the hourly nominal wage has increased over the period 1994-2003 in both public and private sectors and among both Jordanians and foreigners. However, the wage index has increased more rapidly among private workers and in particular among foreign workers. In fact, it grew by 21.9% from 1994 to 1998 and by 22.2% from 2000 to 2003 among foreigners and by 15.7% over 1994-1998 and by 8.0% over 2000-2003 among Jordanian private workers. The growth is smaller in the public sector over the first period (only 3.4%) but is important over the second period (11.3%). Thus, the wage gap between public and private sectors has declined over the period 1994-1998 but has remained stable over the more recent period (2000-03).

Figure 4.1

Table 4.2 presents the real hourly wage index that has been estimated based on the Consumer Price Index (CPI)<sup>16</sup>. Jordanian workers in the public sector have been affected by a real wage decline from 1994 to 1998 (by 10.7%) but their real wage increased by 5.7% over the 2000-03 period compensating a part of the initial loss. The real wage index has remained stable for Jordanian workers in the private sector. On the opposite, it rose significantly among foreign workers (by 5.3% from 1994 to 1998 and by 16.0% from 2000 to 2003).

#### 4.5 Sector and Gender

Table 4.3 presents the nominal hourly wage index by sector of ownership and gender among Jordanians over the period 1994-2003. It clearly shows a gender wage gap in favor of males in both public and private sectors. In 2003, the hourly wage index is around JD 1.31 for males compared to JD 1.25 for females in the public sector. In the private sector, the male wage is around JD 0.89 compared to only JD 0.71 for females that same year. The gender wage gap is larger in the private sector than in the public sector. In 2003, the male wage was higher than the female wage by 5.10% in the public sector, whereas in the private sector it is higher by 28.68%.

|   | Females | 100.0 | 100.4 | 105.8 | 111.7 | 109.4 | 100.0 | 105.0 | 107.1 | 104.4 |

Figure 4.2

Table 4.3 and Figure 4.2 present the evolution of the nominal hourly wage index among Jordanians by sector and gender from 1994 to 1998 and from 2000 to 2003. They reveal that over the first period of analysis, the wage index for males and females followed a parallel trend in each sector (except from 1997 to 1998 in the private sector) growing faster in the private sector as seen above. However, the male growth rate is higher than the female one in both sectors, increasing the gender wage gap. Over the second period (2000-03), except from 2002 to 2003, the overall growth rate is smaller among females in the public sector and almost the same among males and females in the private sector.

Table 4.4 presents the real hourly wage index by sector and gender. It shows that the real wage index remained stable from 1994 to 1998 only for men working in the private sector. On the contrary, public sector workers (men and women) and female employees in the private sector have suffered from a real wage decline (-10.1%, -12.4% and -5.5% and respectively).

Table 4.4: Real Hourly Wage Index by Sector and Gender, 1994-1998 & 2000-2003

|  | 1994    | 1995  | 1996  | 1997  | 1998  | 2000  | 2001  | 2002  | 2003  |       |
|--|---------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| CPI  | 100.0   | 102.3 | 109.0 | 112.3 | 115.8 | 100.0 | 101.8 | 103.6 | 105.3 |       |
| Real Hourly Wage Index (1994=100 for 1994-1998 & 2000=100 for 2000-2003) |         |       |       |       |       |       |       |       |       |       |
| Public sector  | Males   | 100.0 | 92.1  | 89.1  | 89.2  | 89.9  | 100.0 | 110.2 | 107.8 | 105.2 |
|  | Females | 100.0 | 91.0  | 87.9  | 89.1  | 87.6  | 100.0 | 100.4 | 99.9  | 106.2 |
| Private Sector   | Males   | 100.0 | 100.8 | 100.1 | 102.7 | 101.1 | 100.0 | 103.9 | 103.3 | 103.2 |
|  | Females | 100.0 | 98.1  | 97.1  | 99.5  | 94.5  | 100.0 | 103.2 | 103.3 | 99.1  |

From 2000 to 2003, as the CPI increased at a slower pace, real hourly wages were increasing among males and females in the public sector (+ 5.2% and +6.2% respectively) and among male employees in the private sector (+3.2%) while they remained stable among females working in the private sector.

## 4.6 Sector and Economic activity

Table 4.5 shows that the hourly wage varies a lot by economic activity. It ranges between JD 0.66 in the wholesale and retail sector and JD 1.92 in the finance and insurance sector in 2003.

Table 4.5: Nominal Hourly Wage by Economic Activity among Jordanians, 1994-1998 & 2000-2003

| Economic Activity                      | 1994 | 1995 | 1996 | 1997 | 1998 | 2000 | 2001 | 2002 | 2003 |
|--|------|------|------|------|------|------|------|------|------|

| Finance & Insurance                    | 1.47 | 1.37 | 1.58 | 1.74 | 1.78 | 1.96 | 2.07 | 2.08 | 1.92 |
| Real Est. & Bus. Serv.                 | 0.92 | 0.99 | 0.97 | 0.92 | 0.97 | 1.02 | 1.05 | 1.10 | 1.07 |
| Public Administration                  | 1.03 | 0.92 | 0.97 | 0.98 | 1.01 | 0.96 | 1.03 | 1.05 | 1.00 |
| Education                              | 1.16 | 1.14 | 1.16 | 1.23 | 1.26 | 1.15 | 1.22 | 1.28 | 1.31 |
| Health & Soc. Serv.                    | 0.66 | 0.87 | 0.92 | 0.98 | 1.02 | 1.05 | 1.19 | 1.09 | 1.11 |
| Other Community, Personal & Soc. Serv. | 0.77 | 1.01 | 0.93 | 0.97 | 0.95 | 0.66 | 0.68 | 0.63 | 0.71 |

As shown in Annex Tables 17 & 18, the most rewarding sectors in terms of nominal hourly wage in the public sector are the following: real estate and business services (JD 2.02); mining and quarrying (JD 1.84) and finance and insurance (JD 1.82). In the private sector, the finance and insurance sector (JD 1.94) is by far the sector with the highest hourly wage.

On the opposite end, nominal hourly wages are the lowest in the wholesale and retail trade, public administration and in the restaurant and hotels sectors in both private and public sectors, reaching only JD 0.66 in the private sector. Wages are also very low in public administration and in the other community, personal and social services in the private sector.

The nominal wage varies a lot in the manufacturing sector across private and public sectors. Indeed, the wage index reaches a high of JD 1.62 in the public sector, whereas it is very low in the private sector (only JD 0.75).

Table 4.6: Nominal Hourly Wage Index by Economic Activity among Jordanians (1994=100 for 1994-1998 and 2000=100 for 2000-2003)

| Economic Activity                      | 1994  | 1995  | 1996  | 1997  | 1998  | 2000  | 2001  | 2002  | 2003  |
|--|-------|-------|-------|-------|-------|-------|-------|-------|-------|

| Finance & Insurance                    | 100.0 | 92.9  | 107.4 | 118.3 | 120.6 | 100.0 | 105.3 | 106.3 | 98.1  |
| Real Est. & Bus. Serv.                 | 100.0 | 106.6 | 104.6 | 99.4  | 105.3 | 100.0 | 103.2 | 108.4 | 105.6 |
| Public Administration                  | 100.0 | 90.1  | 94.8  | 95.9  | 98.5  | 100.0 | 107.4 | 109.7 | 104.2 |
| Education                              | 100.0 | 97.9  | 99.9  | 105.5 | 108.6 | 100.0 | 106.1 | 111.8 | 113.9 |
| Health & Soc. Serv.                    | 100.0 | 132.7 | 139.7 | 148.9 | 155.4 | 100.0 | 113.6 | 104.1 | 105.3 |
| Other Community, Personal & Soc. Serv. | 100.0 | 131.1 | 120.5 | 125.4 | 122.9 | 100.0 | 103.2 | 96.0  | 108.2 |

Almost all economic activities have experienced a rise in the hourly nominal wage from 1994 to 1998 and from 2000 to 2003 as shown in Table 4.6. The only exceptions are public administration (-1.5%), utilities' sector (-9.7%) over the period 1994-1998 and the finance and insurance sector (-1.9%) over the period 2000-2003.

Over the first period of analysis, workers in the health and social services (+55%), mining and quarrying (+26%), restaurants and hotels (+25%), other community, personal and social services (+23%), finance and insurance (+21%), wholesale and retail trade (+20%) and manufacturing (+19%) sectors have benefited from important nominal wage growth. On the opposite, the nominal wage

only declined in the utilities' sector (-10%) and in public administration (-1.5%). From 2000 to 2003, the nominal wage increased or remained stable in all economic activities except in the finance and insurance sector.

Table 4.7 shows that the real hourly wage increased in the following economic activities over both 1994-1998 and 2000-2003 periods: restaurants and hotels sector (+8.2% and +11.1%), mining and quarrying (+ 8.7% and +3.9%), other community, personal and social services (+6.2% and +2.7%), manufacturing (+2.4% and +5.6%) and wholesale and retail trade (+3.6% and +2.3% respectively). From 2000 to 2003, the fluctuations are smaller. The real wage index has slightly increased or slightly decreased, except in the finance and insurance sector (-6.9%), transport, storage and communication sector (+11.9%), restaurant and hotels (+11.1%) and education (+8.1%).

Table 4.7: Real Hourly Wage Index by Economic Activity among Jordanians (1994=100 for 1994-1998 and 2000=100 for 2000-2003)

| Economic Activity                      | 1994  | 1995  | 1996  | 1997  | 1998  | 2000  | 2001  | 2002  | 2003  |

#### 4.7 Sector and Occupation

Table 4.8 reveal that, as expected, workers in low skilled occupations receive low nominal wages such as service and sales workers, elementary occupations, agricultural and fishing workers, and craft and related trade workers. In 2003, their nominal hourly wage ranges between JD 0.58 and JD 0.68. On the opposite end, legislators, senior officials and professionals are getting JD 2.96 and JD 1.52 per hour respectively that same year.

Disparities are more important in the private sector than in the public sector (see Annex Tables 23 & 26). Indeed, in 2003, the legislators' hourly wage is 6 times higher than the one obtained by workers in elementary occupations, compared to less than 4 times higher in the public sector.

Apart from agriculture workers and technicians and associate professionals, all workers benefited from a rise in the nominal hourly wage that ranges between 2% and 21% from 1994 to 1998 (Table 4.9). From 2000 to 2003, nominal hourly wages increased in all occupations except among legislators and senior officials. The rise ranges between 2% and 20%.

| Technicians & assoc. profs.              | 100.0 | 75.1  | 74.5  | 71.9  | 70.9  | 100.0 | 106.0 | 98.1  | 96.8  |

Table 4.10 presents the trend in the real wage index from 1994 to 1998 and from 2000 to 2003. Over the second half of the nineties, the real wage remained stable or declined among all occupations except among the legislators and senior officials (+5%). The decline was particularly sharp among agriculture and fishing workers (-36%)<sup>17</sup> and technicians (-30%).

On the opposite, from 2000 to 2003, the real wage index increased in almost all occupations except among legislators (-9%) and technicians (-3%).

## 4.8 Conclusions

The main conclusions from the analysis of wage trends in Jordan is that private sector wages rose slightly faster than wages in the public sector in the previous decade, although they remain lower. Wages for foreign nationals in the private sector rose even faster although they started at a lower base. Wages for men in the private sector rose faster than for women, although the difference was not large. The largest increase in wages in the 1994-98 period occurred in the health and social services industry, followed by mining and quarrying and restaurant and hotels. In the 2000-03 period, the largest increases were in transport storage and communications, restaurants and hotels, and education. In terms of occupations, wages rose the most among senior officials and elementary occupations in 1994-98 and among services and sales workers, professionals, and elementary occupations in 2000-03. These results underline the dynamism of Jordan's service economy, especially the tourism sector, in recent years.

---

<sup>17</sup> This result could be due to the fact that agriculture and fishing workers are underrepresented in the establishment surveys.
